

# Industrial-Driven Big Data as a Self-Service Solution

## Introduction

Despina Kopanaki (FORTH)

I-BiDaaS Final Event

December 21, 2020

# Housekeeping rules

- All attendees are muted by default during this session.
- To ask a question, use the Zoom Q&A panel or raise your hand.
- The speakers will reply back to you via text or answer live during the Q&A session.
- Contact the session facilitator, Dr. Andreas Miaoudakis, if you have any technical issue.

# Now you

- **To which of our stakeholder type do you belong?**
  - (*Big Data Provider, Big Data Technology Provider, Research & Academia, Financial, Telecommunication, Manufacturing, other*)
- **Are you working with Big Data?**
  - (*Yes, No*)
- **Are you interested in Big Data Technologies to optimize your customer experience?**
  - (*Yes, No, Maybe*)
- **What is the main barrier or risk preventing you from implementing Big Data analytical solutions in your organization?**
  - (*Costs, Lack of expertise, Uncertain Value (ROI)*)

# Speakers

## Prof. Sotiris Ioannidis

Associate Professor - Technical University of Crete, Greece

Affiliated Researcher - Institute of Computer Science, Foundation for Research and Technology – Hellas

I-BiDaaS Project Coordinator

## Nuria de Lama

European Programs Manager, Atos Research & Innovation – Member of Board of Directors, BDVA, Spain

# Speakers

## Prof. Dušan Jakovetić

Associate Professor at the  
Department of Mathematics and  
Informatics, Faculty of Sciences,  
University of Novi Sad, Serbia

I-BiDaaS Scientific & Technical  
Manager.

## Dr. Ramon de Pozuelo

Project Manager at  
Security Innovation &  
Transformation,  
CaixaBank, Barcelona, Spain

## Dr. Ioannis Arapakis

Researcher at Telefonica,  
Barcelona, Spain

# Speakers

**Giuseppe Danilo  
Spennacchio**

Flexible and Adaptive Systems  
Specialist at Factory Innovation  
Department, CRF, Italy

**Dr. Vassilis Chatzigiannakis**

Technical Manager, ITML, Greece

**Dr. Hernan Ruiz Ocampo**

Project Manager, Ecole Nationale des  
Ponts et Chaussées, Paris, France

Welcome and Introduction – Despina Kopanaki  
(FORTH)

- 10:00 Welcome and Introduction – Despina Kopanaki (FORTH)
- 10:05 **Keynote:** A 5-years journey through the European Big Data Landscape – Nuria de Lama (ATOS, BDVA)
- 10:35 I-BiDaaS **Overview** – Prof. Sotiris Ioannidis (TUC, FORTH)
- 10:45 I-BiDaaS **Scientific & Technical view** – Prof. Dusan Jakovetic (UNSPMF)
- 11:05 **Pilot 1:** I-BiDaaS Application to the **banking** sector – Dr. Ramon Martin de Pozuelo (CAIXA)
- 11:35 Break
- 11:50 **Pilot 2:** I-BiDaaS Application to the **telecommunication** sector – Dr. Ioannis Arapakis (TID)
- 12:20 **Pilot 3:** I-BiDaaS Application to the **manufacturing** sector - Giuseppe Danilo Spennacchio (CRF)
- 12:50 I-BiDaaS **Platform Demonstration** – Dr. Vassilis Chatzigiannakis (ITML)
- 13:05 The I-BiDaaS **business & commercial offering** – Hernan Ruiz Ocampo (ENPC)
- 13:25 Q&A, Closing

CONTRACTUAL ARRANGEMENT  
SETTING UP A PUBLIC-PRIVATE PARTNERSHIP IN THE AREA OF DATA  
BETWEEN  
THE BIG DATA VALUE ASSOCIATION  
AND  
THE EUROPEAN UNION

The Big Data Value Association (registered offices: rue de Trèves 49/51, 1040 Brussels, Belgium), hereinafter referred to as 'the Private Side', and the European Union, represented by the Commission (jointly hereinafter referred to as 'the Parties').

CONSIDERING THAT:

- The European Union's Horizon 2020 Framework Programme for research and innovation<sup>1</sup> may be implemented through public-private partnerships taking the form of a contractual arrangement between the partners committed to supporting the development and implementation of research and innovation activities of strategic importance to the Union's competitiveness and industrial leadership.
- The specific programme implementing Horizon 2020<sup>2</sup> has identified potential areas for establishing public-private partnerships.
- The rules for participation and dissemination in Horizon 2020<sup>3</sup> apply to the indirect actions to be financed by the Commission in the context of this arrangement.

<sup>1</sup> Regulation (EU) No 1291/2013 of the European Parliament and of the Council of 11 December 2013 establishing Horizon 2020 — the Framework Programme for Research and Innovation (2014-2020) and repealing Decision No 1982/2006/EC (OJ L 347, 20.12.2013, p. 104).

<sup>2</sup> Council Decision (EU) No 743/2013 establishing the specific programme implementing Horizon 2020 — the Framework Programme for Research and Innovation (2014-2020) and repealing Decisions 2006/971/EC, 2006/972/EC, 2006/973/EC, 2006/974/EC and 2006/975/EC (OJ L 347, 20.12.2013, p. 965).

<sup>3</sup> Regulation (EU) No 1290/2013 of the European Parliament and of the Council of 11 December 2013 laying

# BDVA Reference Framework

- 50+ Projects are part of the PPP portfolio, contributing to technology generation and uptake

# Access to data and data sharing

## Profile of data suppliers

Data suppliers

- ✓ Mainly large companies
- ✓ 90% share data **within their own business sector**
- ✓ A majority only share a **small percentage** of the data they generate
- ✓ 1 in 5 consider data sharing as their **main economic activity**
- ✓ 1 in 3 have been sharing data for over 8 years
- ✓ Very few adopt an Open Data Policy
- ✓ **Developing new business models** and/or services and products as main motivation

Data users

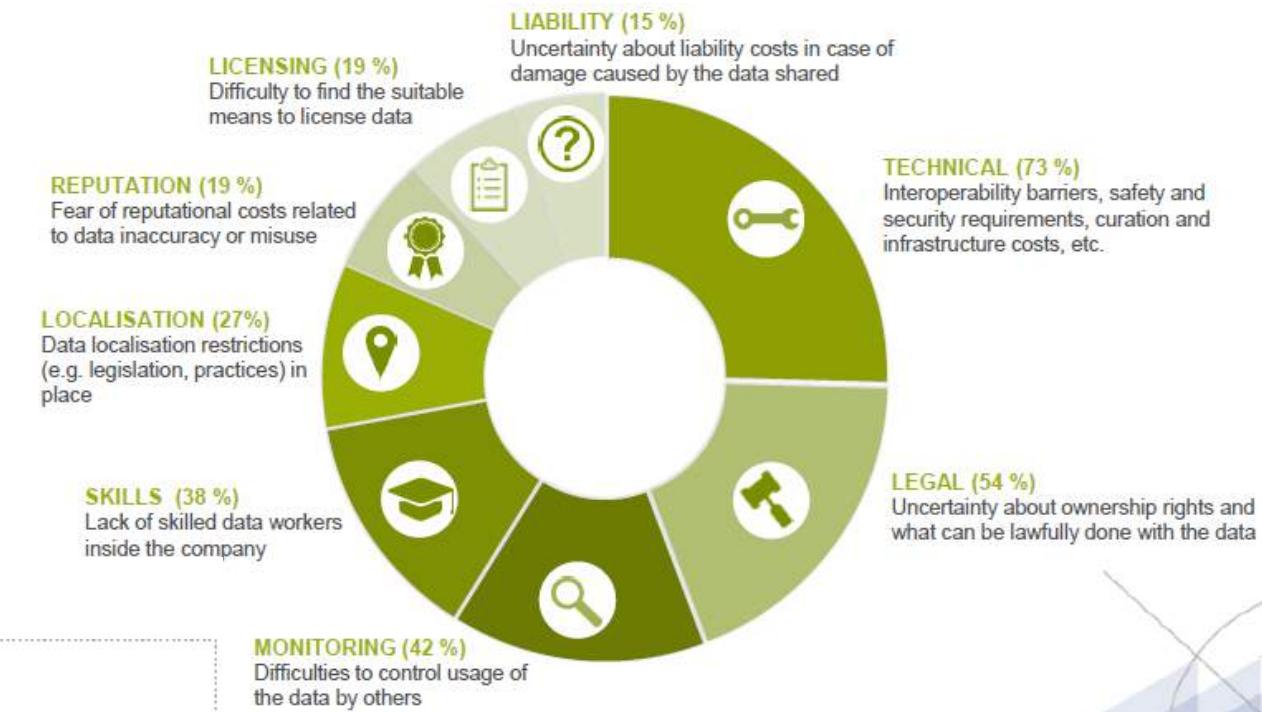

- ✓ Mainly large companies
- ✓ Mostly re-using data **from their own sector (83%)**
- ✓ **7 in 10 strongly depend on data** for their business
- ✓ Half of them have been re-using data for over 6 years
- ✓ More than 40 % have spent over €50 000/year to access data in the last years
- ✓ **Developing/improving** the catalogue of services and products as main motivation

1 in 2 experience **obstacles** to make their data available

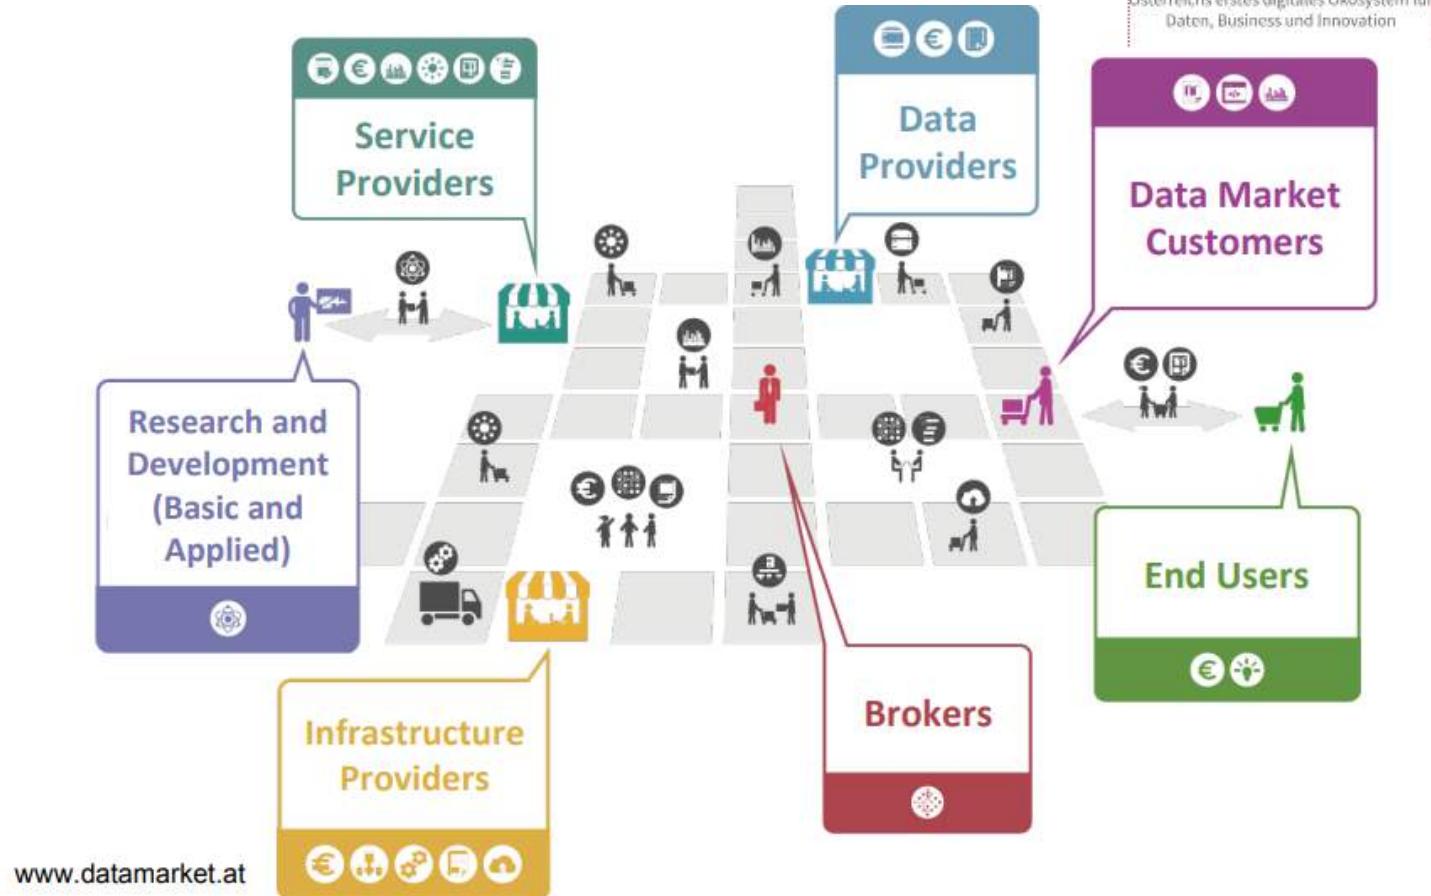

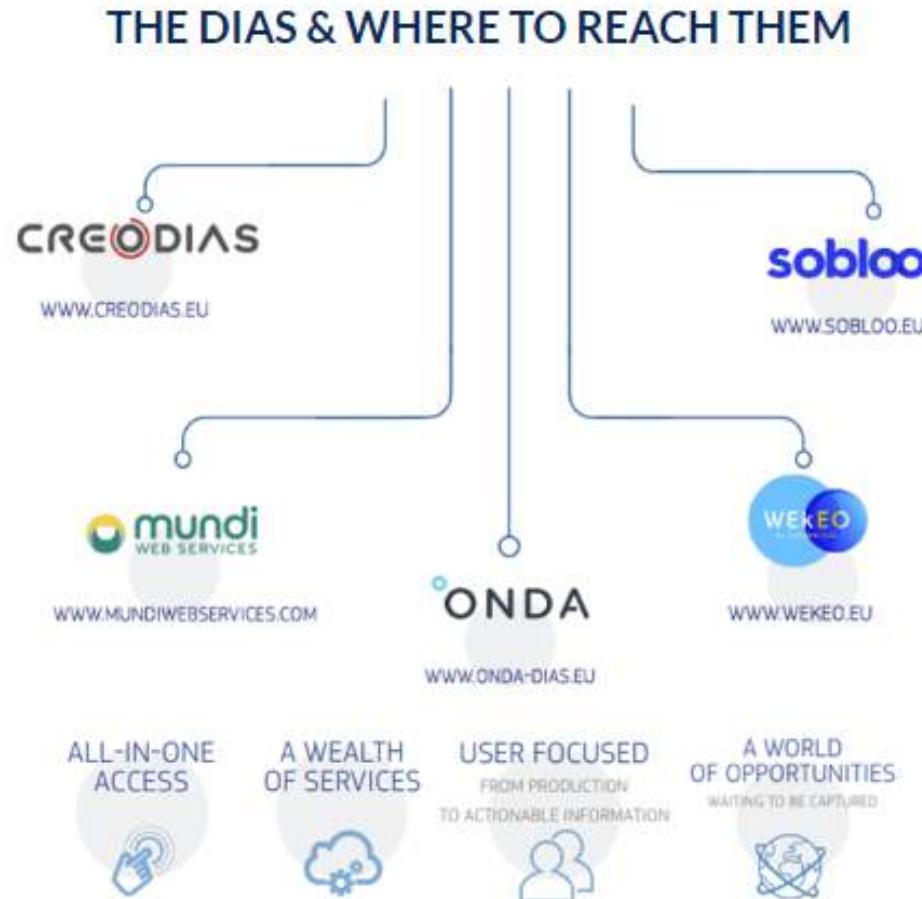

6 in 10 experience **obstacles** to access data from others

Source: Everis (Study on B2B data sharing; 2018)

# Data sharing: the role of Data Platforms

# Towards a European-governed Data Sharing Space

# Common European Data Spaces

Rich pool of data  
(varying degree of accessibility)

Free flow of data  
across sectors and countries

Full respect of GDPR

Horizontal  
framework for data  
governance and data  
access

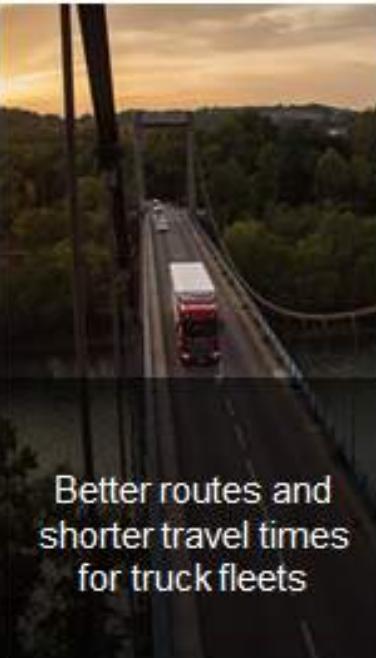

- Technical tools for data pooling and sharing
- Standards & interoperability (technical, semantic)
- Sectoral Data Governance (contracts, licenses, access rights, usage rights)
- IT capacity, including cloud storage, processing and services

# Lighthouse Projects to illustrate the transformative power of data

## SAFER AND BETTER MOBILITY IN EUROPEAN ROADS AND CITIES

Better traffic control, less accidents on the road

Better routes and shorter travel times for truck fleets

## MORE RELIABLE AND PRODUCTIVE TRANSPORT SERVICES AND OPERATIONS

Decrease of service disruption and improved safety for passengers

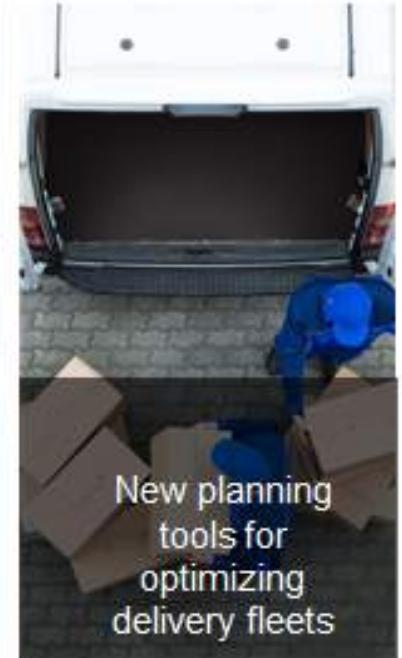

Mitigation of delays and more efficient terminals

## ENHANCED TRAVELER AND CUSTOMER EXPERIENCE

Improved passenger flows and aircraft turnaround

New planning tools for optimizing delivery fleets

Accurate traffic and accidents predictions

↓ 17%

Truck driving and handling process

↓ 34%

Rail infrastructure maintenance costs

↓ 10%

Terminal operational costs

Optimization of airport resources and creation of new data-driven business models

↓ 38%

Number of distribution vehicles used

# The value of Data: Data companies, economy and society

## Indicator 2: Data Companies

### Data suppliers

2018  
283

2019  
290

Data suppliers have as their main activity the production and delivery of digital data-related products, services, and technologies.

15%

Companies Share as a % of total companies in ICT and Professional Services, '19

### Data users

2018  
712

2019  
716

Data users are organisations that generate, exploit collect and analyse digital data intensively and use what they learn to improve their business.

6.7%

Companies Share as a % of total companies, '19

## Indicator 3: Data suppliers' revenues

2018  
77

2019  
84

The aggregated value of all the data-related products and services generated by EU Data suppliers companies.

## Indicator 4: Value of the Data Market

2018  
72

2019  
75

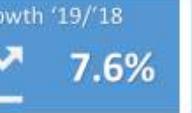

The marketplace where digital data is exchanged as "products" or "services" as a result of the elaboration of raw data.

## Indicator 5: Value of the Data Economy

2018  
378

2019  
406

The Data Economy measures the overall impacts of the data market on the economy as a whole.

2.8%

Share of EU GDP, '19

2.8%

## Key Numbers 2019 for EU27 + U.K.

## Baseline Scenario 2025 for EU27

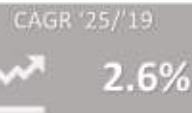

## Indicator 2: Data Companies

### Data suppliers

2019  
149

2025  
173

Data suppliers have as their main activity the production and delivery of digital data-related products, services, and technologies.

Companies Share as a % of total companies in ICT and Professional Services, '25

12.8%

### Data users

2019  
535

2025  
583

Data users are organisations that generate, exploit collect and analyse digital data intensively and use what they learn to improve their business.

Companies Share as a % of total companies, '25

6.3%

## Indicator 3: Data Suppliers' revenues

The aggregated value of all the data-related products and services generated by EU Data suppliers companies.

2019  
64

2025  
99

## Indicator 4: Value of the Data Market

The marketplace where digital data is exchanged as "products" or "services" as a result of the elaboration of raw data.

2019  
58

2025  
83

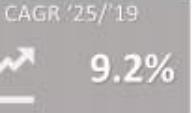

## Indicator 5: Value of the Data Economy

The indicator captures the potential gap between demand and supply of data skills in Europe.

2019  
325

2025  
550

Share of EU GDP, '25

4%

# Impact of the Big Data Value PPP (I)

- 200 members (+27% SMEs)
- **Private investments mobilized** by end of 2018: 1,57 Billion € (Leverage factor: 7,8)
- Growth of **SMEs in the data economy**:
  - Growth in revenues 60% with respect to 2014 (beginning of H2020) and 17,7 % increase in the last year
  - 74,9% increase on FTEs with respect to 2014
- Contribution to increase the number of Data companies in Europe, market share of the European Union in the global Big Data Market, and the number of Data professionals in Europe.
- Contributions to environmental challenges (Energy efficiency, CO2, Waste reduction)

# Impact of the Big Data Value PPP (II)

- **106 innovations** of exploitable value delivered **during 2018**:
  - 39 of significant impact (37%)
  - 67 of medium impact (63%)
- From the 106 innovation of exploitable value delivered during 2018:
  - **53 incremental innovation** (50%)
  - 6 architectural innovation (5,7%)
  - **38 disruptive innovation** (35,8%)
  - 1 radical innovation (0,0%)
  - 8 were not categorised under any of these categories
- 99 over 106 innovations can generate **economic impact** (93%) and 48 (45%) **societal impact**

# Data skills

## Key Numbers 2019 for EU27 + U.K.

### Indicator 1: Data Professionals

Workers who collect, store, manage, analyse, interpret, and visualise data as their primary or as a relevant part of their activity.

The indicator captures the potential gap between demand and supply of data skills in Europe.

### Indicator 6: Data Professionals Skills Gap

Workers who collect, store, manage, analyse, interpret, and visualise data as their primary or as a relevant part of their activity.

### Indicator 1: Data Professionals

The indicator captures the potential gap between demand and supply of data skills in Europe.

### Indicator 6: Data Professionals Skills Gap

## Baseline Scenario 2025 for EU27

Source: EDM Monitoring Tool, IDC 2020

# Contributions of the Big Data Value PPP

Based on figures from MR2018

- Over 7.500 new jobs created by 2023 linked to project activities
- 48 new job profiles reported in 2018
- 85 training activities during 2018 involving over 9700 participants
- 16 developed interdisciplinary programs during 2018 with around 250 participants,
- 396 equivalent Master and Phd FTEs (260 Master and 136 Phd)
- 323 events outreaching over 630.000 participants

# Contributions of the Big Data Value PPP

Education Hub

Mobility Program

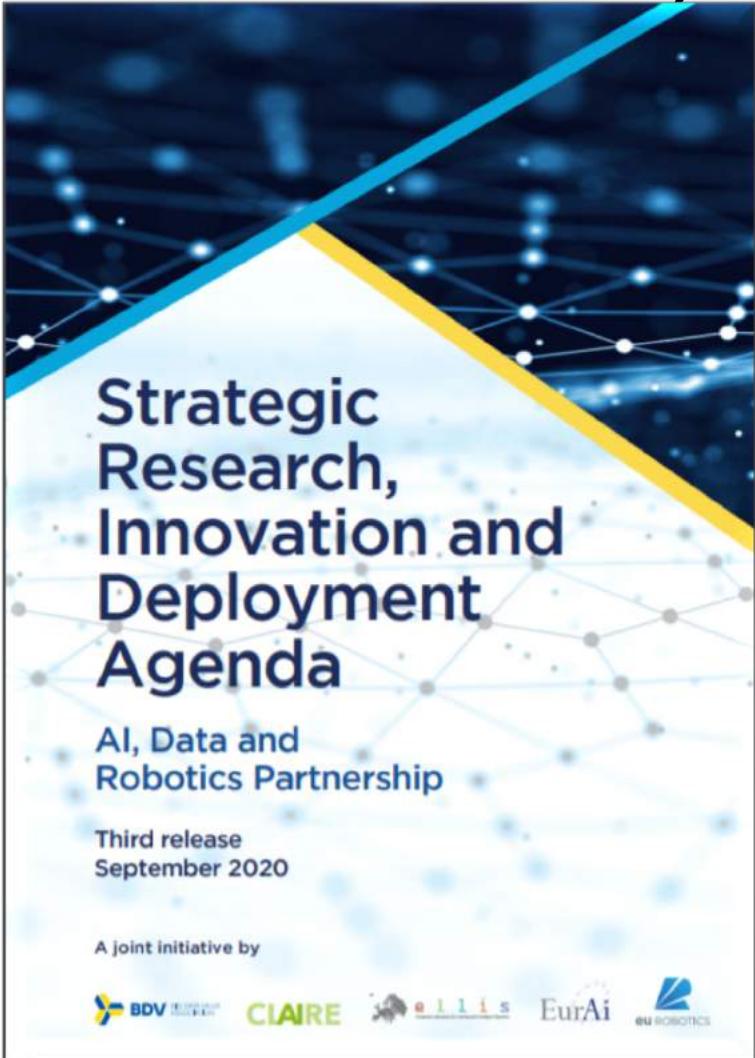

Skills Recognition Program

Big Data Centres of Excellence

# The future: AI, Data and Robotics

## Artificial Intelligence – a real business driver for Europe?

**Artificial Intelligence (AI), Data and Robotics** will create new opportunities, transform many if not all verticals and ultimately shift the balance of power in the shortest possible time. AI, Data and Robotics combined will be the core driver of innovation, productivity and economic growth. Together they can be used to solve the greatest challenges we face: Environmental sustainability; energy, food and water security; and improving health and quality of life. **Europe can and must be the pacemaker worldwide!**

In Europe we must not be shy or afraid. We have our strengths – which we should not neglect. We should use them! Our strengths are our excellent research networks, our well-established companies that are world market leaders in several major verticals, our growing startup communities and, not to forget, our European values. Of course, we must be open and accept the challenges and worldwide competition. To leverage our strength, we brought major European activities for AI (Claire, Ellis, EurAi), Data (BDVA) and Robotics (euRobotics) into a Partnership and setup cooperation with other major European and regional initiatives. This Partnership is the European focal point for AI, Data and Robotics. Europe has all the expertise needed to progress rapidly in the deployment of these technologies, but it needs to direct energy towards building a coherent infrastructure to stimulate deployment and adoption, build up an effective innovation ecosystem and drive excellent research. This Partnership will federate and cohere the communities that underpin European AI, Data and Robotics. It will stimulate private investment and orient public funding to address the key challenges. Collaboration within the Partnership will deliver Europe's vision for a human centric and trustworthy use of AI, Data and Robotics.

It is a pleasure for us to present you this paper – the **Strategic Research, Innovation and Deployment Agenda**! This paper results from the joint work of BDVA, Claire, Ellis, EurAi and euRobotics colleagues. It includes hundreds of contributions collected in consultations with stakeholders, member states, associations, and individuals. Many thanks to all contributors!

# Motivation

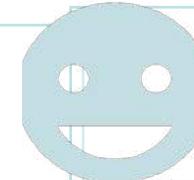

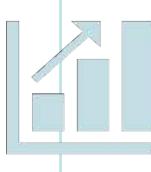

# Our Vision

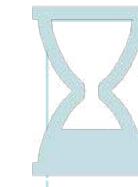

A **complete and safe environment** for methodological **big data experimentation**

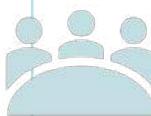

Tool and services to **increase the quality** of data analytics

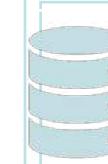

A Big Data as a **Self-Service solution** that boosts EU's data-driven economy

Tools and services for **fast ingestion and consolidation** of both realistic and fabricated data

**Increases impact** in research community and contributes to industrial innovation capacity

Tools and services for the management of **heterogeneous infrastructures** including elasticity

# Project Statement

*I-BiDaaS aims to empower users to easily utilize and interact with big data technologies, by designing, building, and demonstrating, a unified framework that:*

*significantly increases the speed of data analysis while coping with the rate of data asset growth, and facilitates cross-domain data-flow towards a thriving data-driven EU economy.*

*I-BiDaaS will be tangibly validated by three real-world, industry-lead experiments.*

# Objectives

1

Release a **complete and solid Big Data-as-a-Self-Service solution** that can be easily configured and adopted by practitioners

2

**Break inter- and intra-sectorial data-silos**, create a data market and offer new business opportunities (support **data sharing, exchange, and interoperability**)

3

Construct a **safe environment** for methodological **big data experimentation**, for the development of **new products, services, and tools**

4

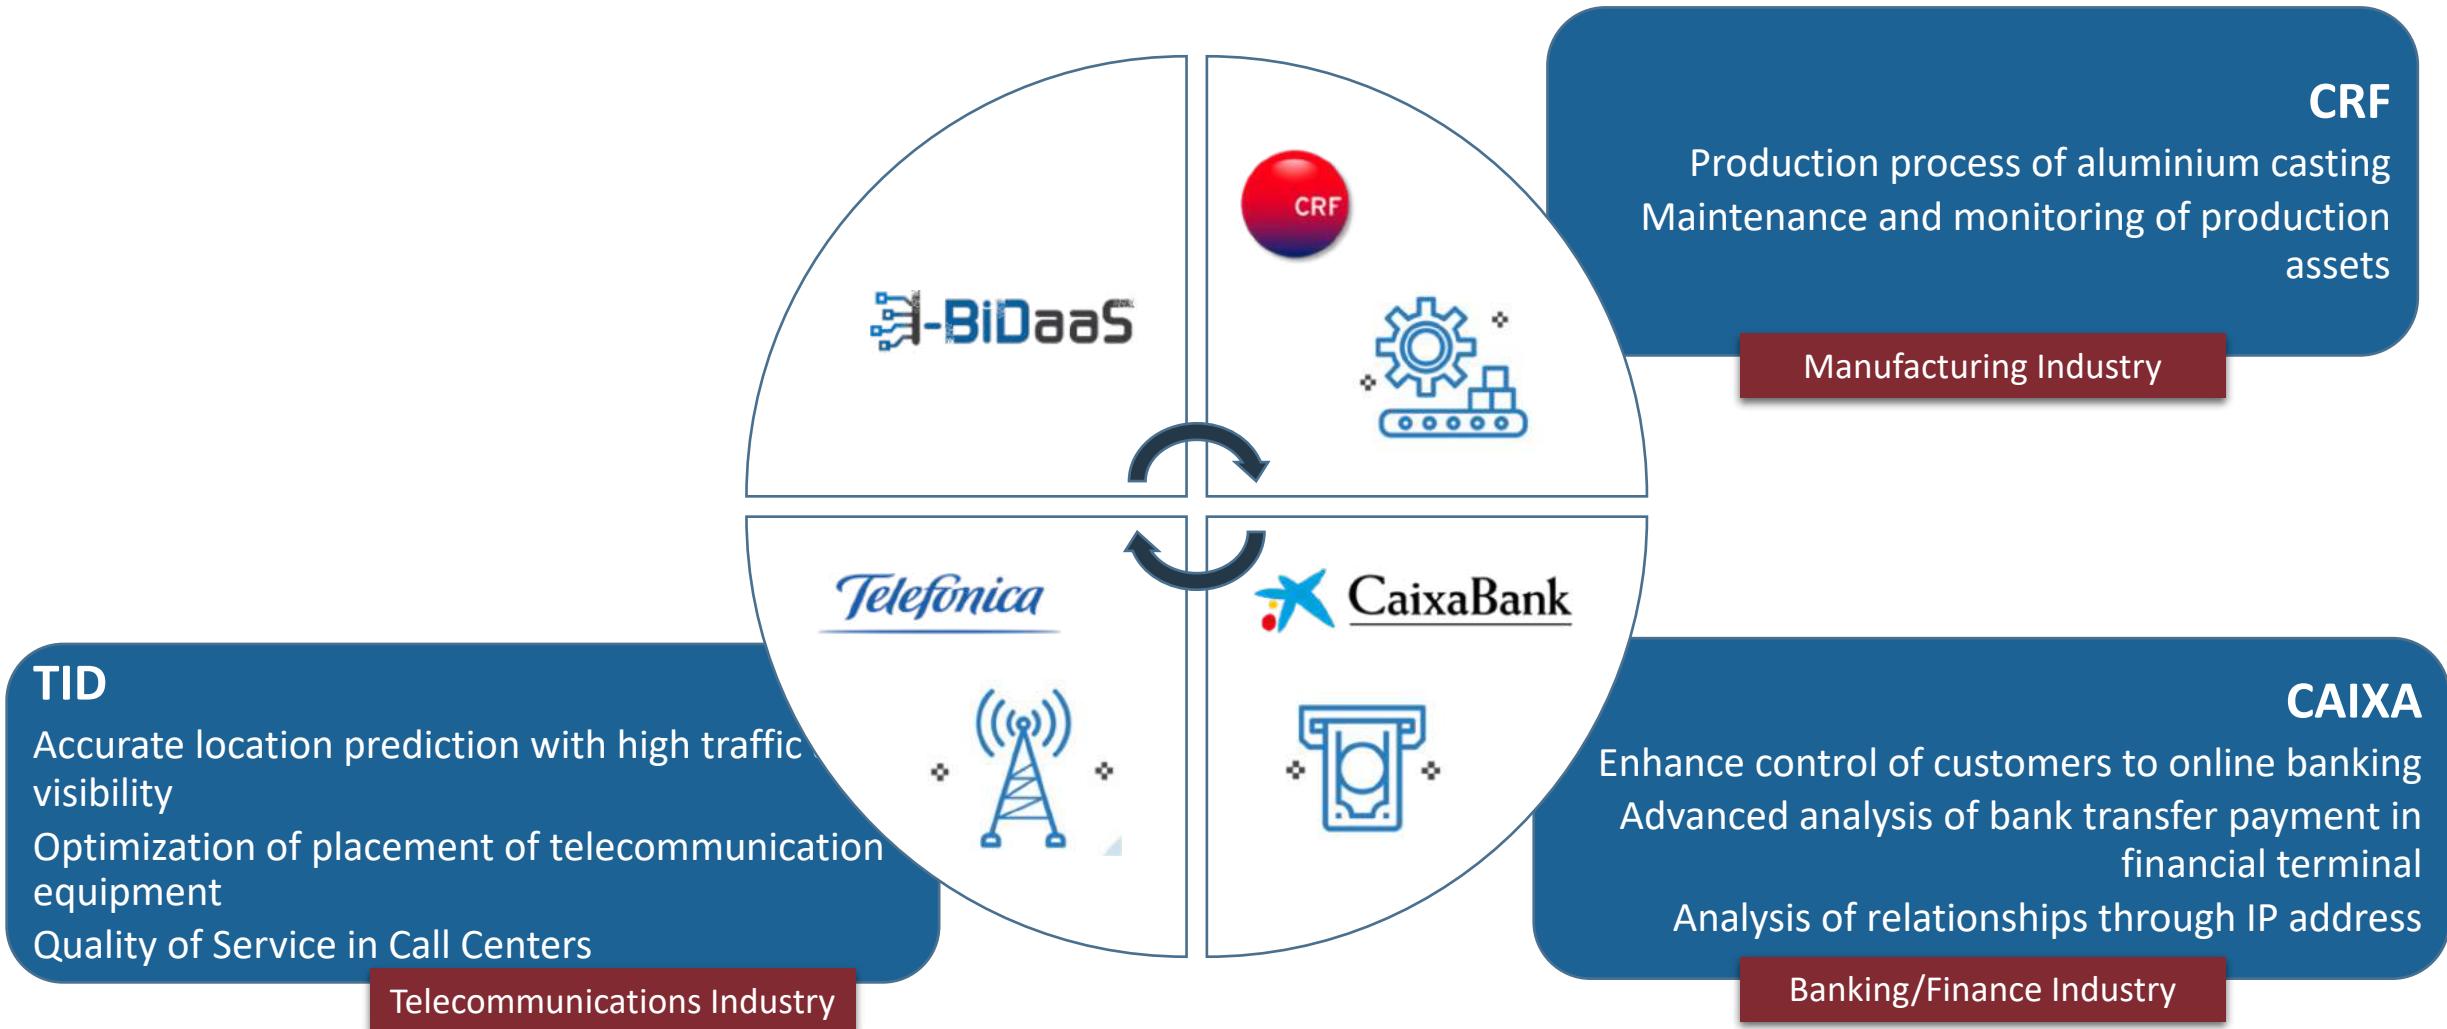

Develop **data processing tools and techniques** applicable in **real-world** settings, demonstrate significant **increase of speed of data throughput**

5

Develop technologies that will increase the efficiency and competitiveness of all EU companies and organisations that need to manage vast and complex amounts of data

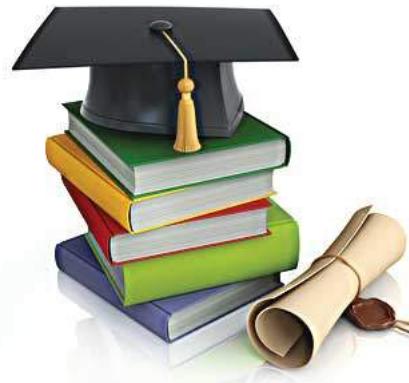

# Application / Experimentation

# I-BiDaaS Target Domains

I-BiDaaS aims to empower IT and non-IT big data experts to easily utilize and interact with big data technologies.

# Excellent Innovations: EU Innovation Radar

## ADMM Machine Learning algorithms

# Excellent Innovations: EU Innovation Radar

## Multidimensional Storage with Efficient Sampling (MuSES)

Using MuSES improves:

**1. initialization**

*initial solution on a sample*

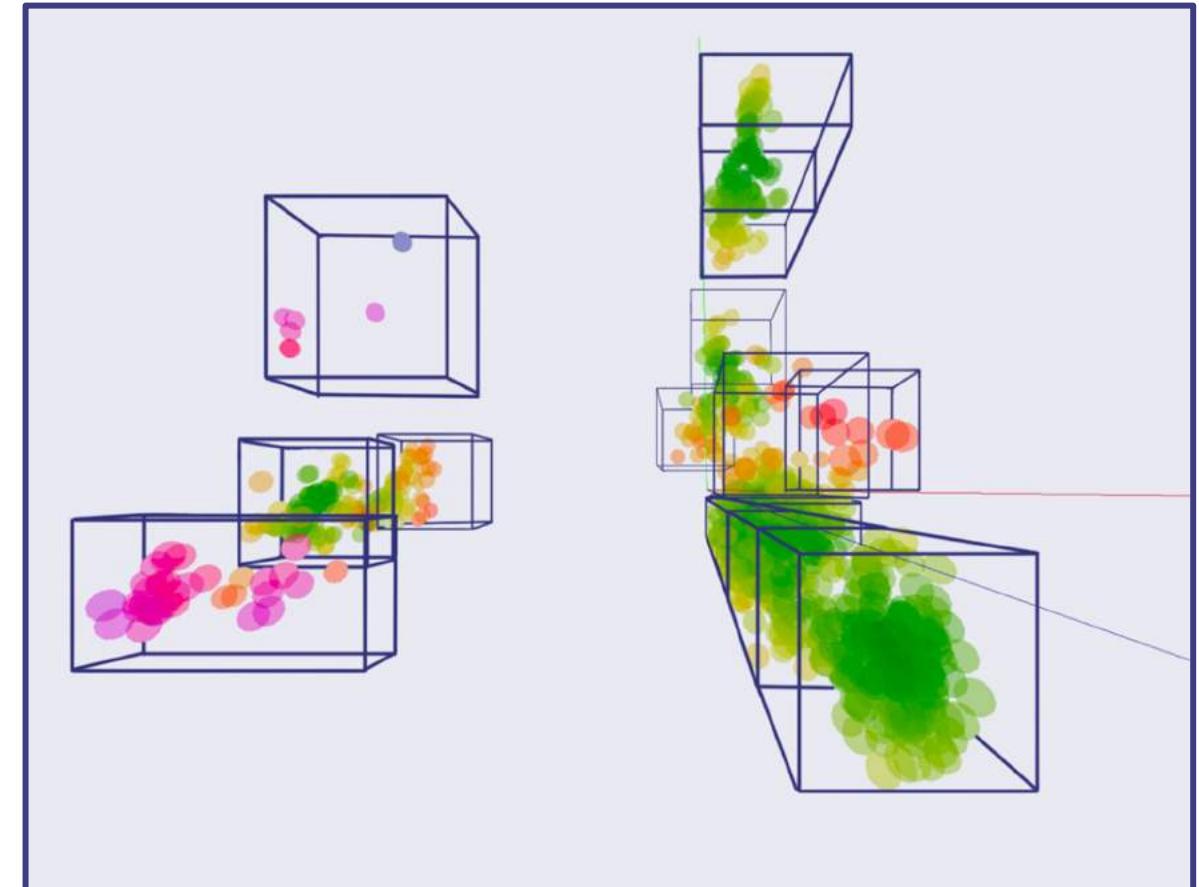

**2. convergence**

*better data partitioning*

**3. scalability**

*convergence on sample, less data to analyse*

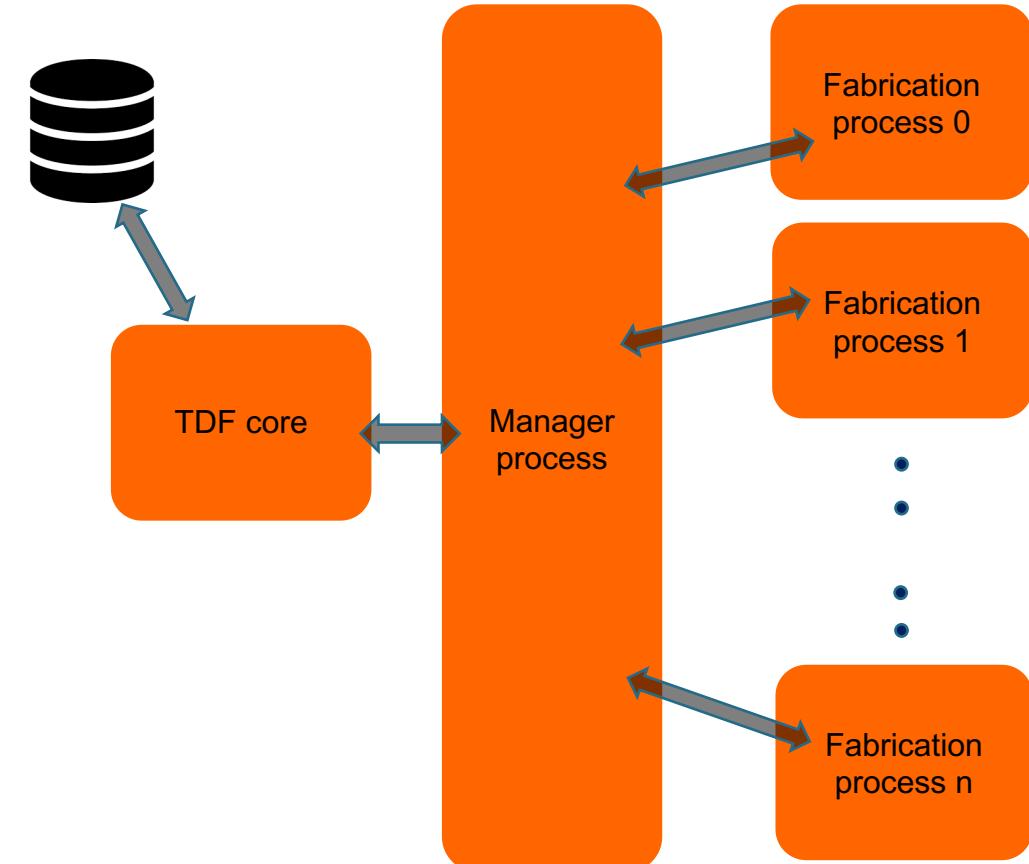

**Plus:** Allows Interactive visualization

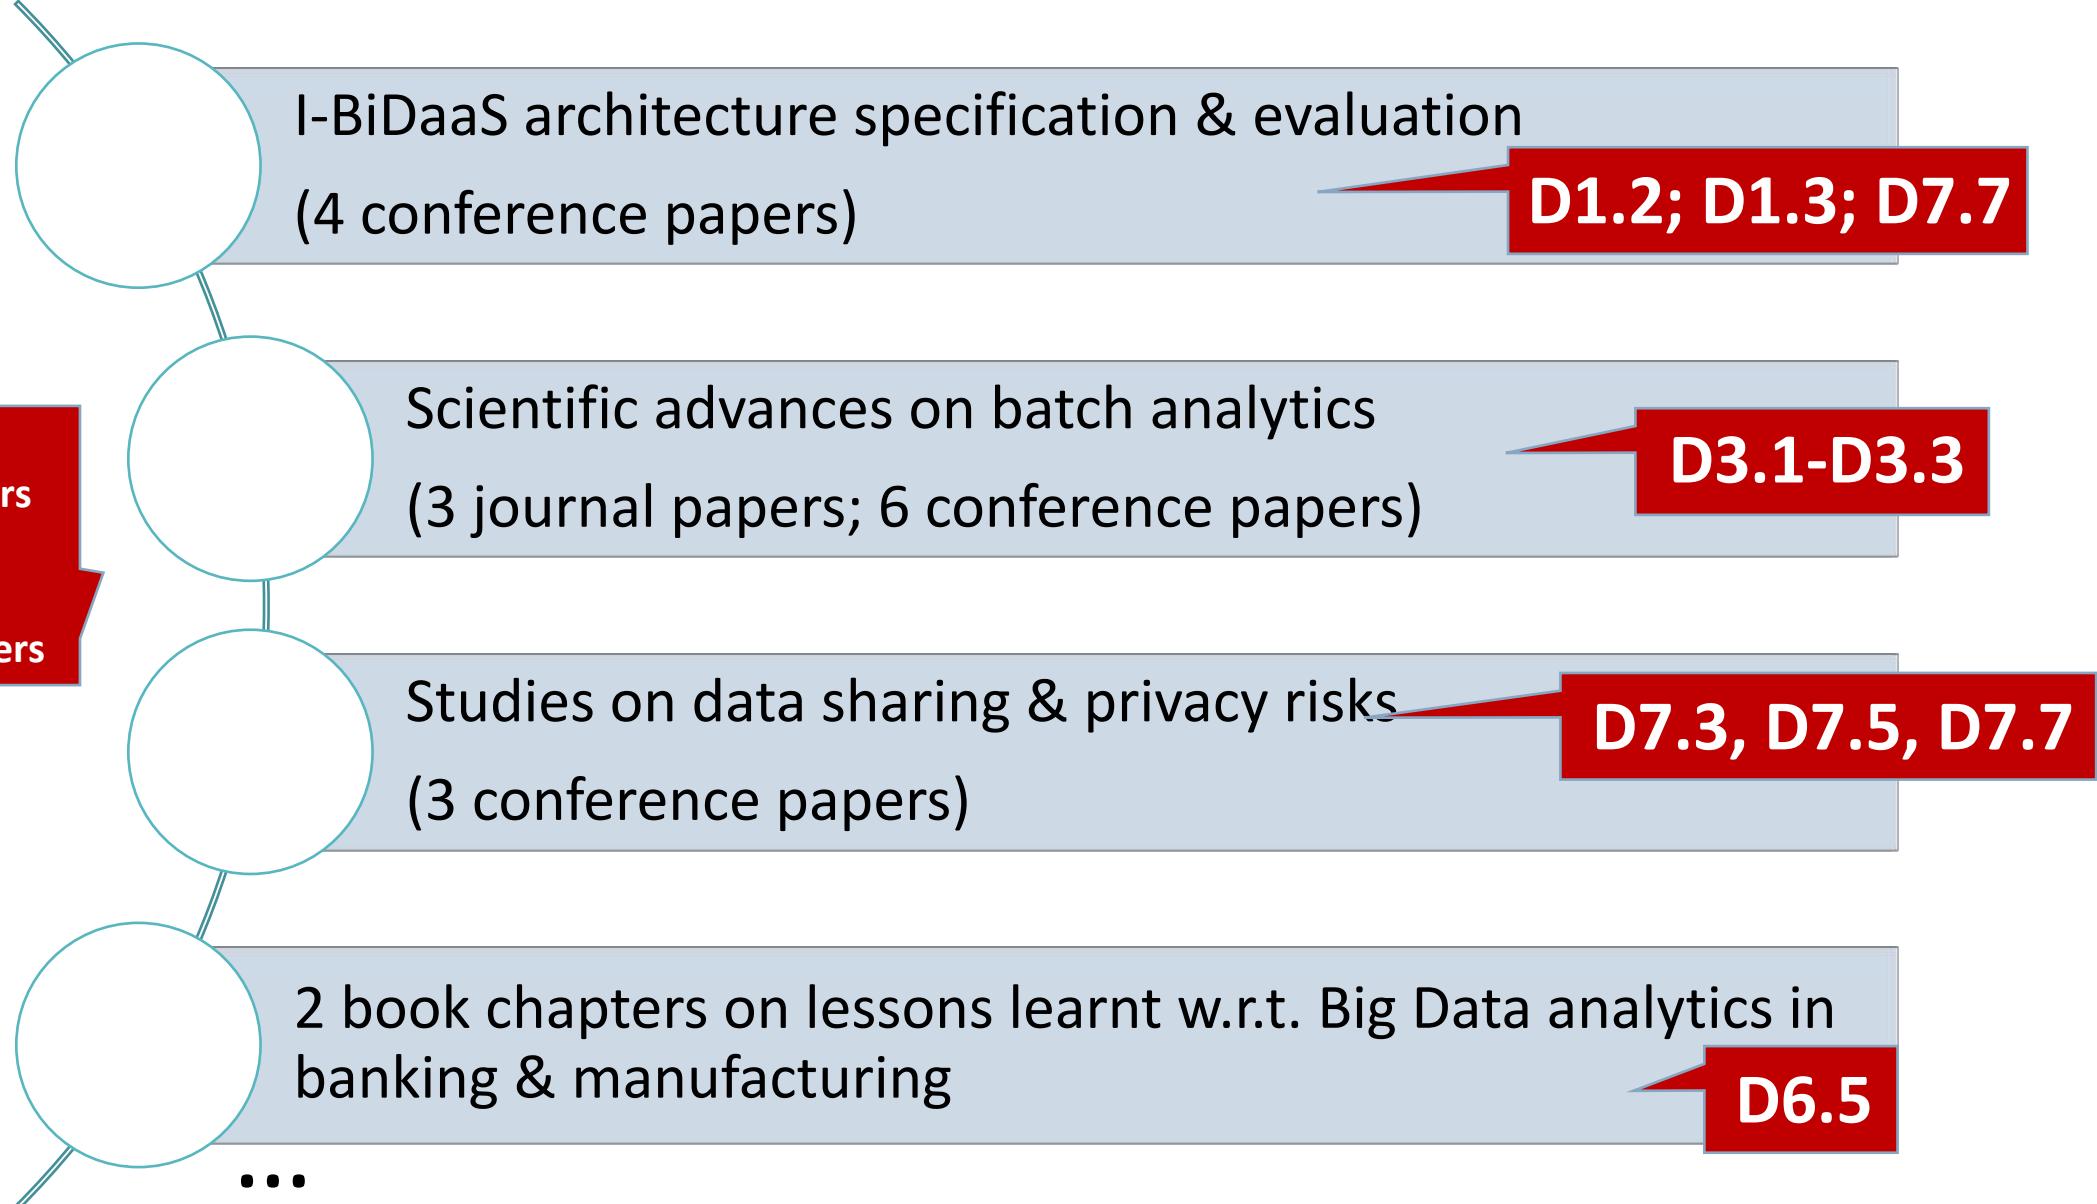

## Parallelization of constraint satisfaction solver within TDF (IBM)

- Simultaneously solve CSP problems to concurrently create values for DB table rows.
- A single manager creates several fabrication processes
- Manager responsibilities
  - Handling data dependencies between different CSP problems
  - Communication with TDF core
  - Sharing DB connections
- Child responsibilities
  - Solving a single CSP problem
  - Fabricating data for a singe table row

# CAIXA: Analysis of relationships through IP addresses

CAIXA 1st case

MVP use case

Find relationships between different customers analysing their bank movements in order to prevent fraud scenarios and bad practices among employees.

| Attribute     | Description   | Format   | Example   |
|---------------|---|----------|-----------|
| FK_NUMPERSO   | Identifier of the Person.<br>(Foreign Key).                           | NUMBER   | 34523454  |
| PK_ANYOMESDIA | Date (YYYYMMDD) when<br>the connection of the user.<br>(Primary Key). | NUMBER   | 20180823  |
| IP_TERMINAL   | IP Address of the<br>connection of the user.                          | VARCHAR2 | 10.8.2.22 |

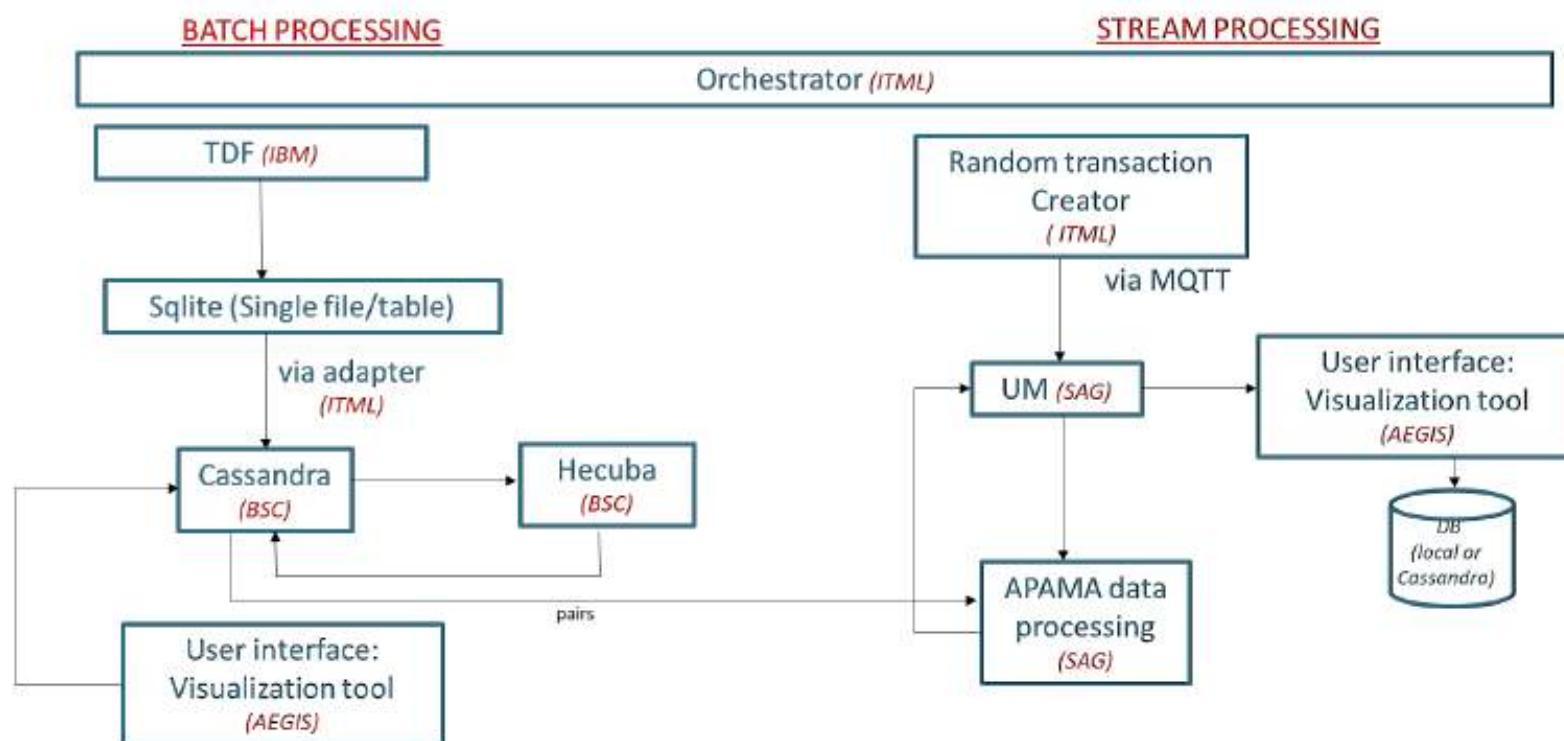

# CAIXA: Analysis of relationships through IP addresses

- **I-BiDaaS approach:**

- Synthetic & real tokenized data generated
- COMPSs script for finding relationships
- **Batch & streaming integrated solution**
- **Kmeans & DBSCAN for clustering of users into groups**
- Validation of the synthetic data by repeating the same analysis on synthetic & real data

D3.2, D5.2, D6.4

- **Production Process of Aluminium Die Casting**

- During the casting process of the engine blocks, molten aluminium is injected into the die cavity
- Can we classify the quality levels of engine blocks correctly at the time they are produced?
- Can we improve the production process, by increasing the number of high quality engine blocks and decreasing the number of lower quality engine blocks?

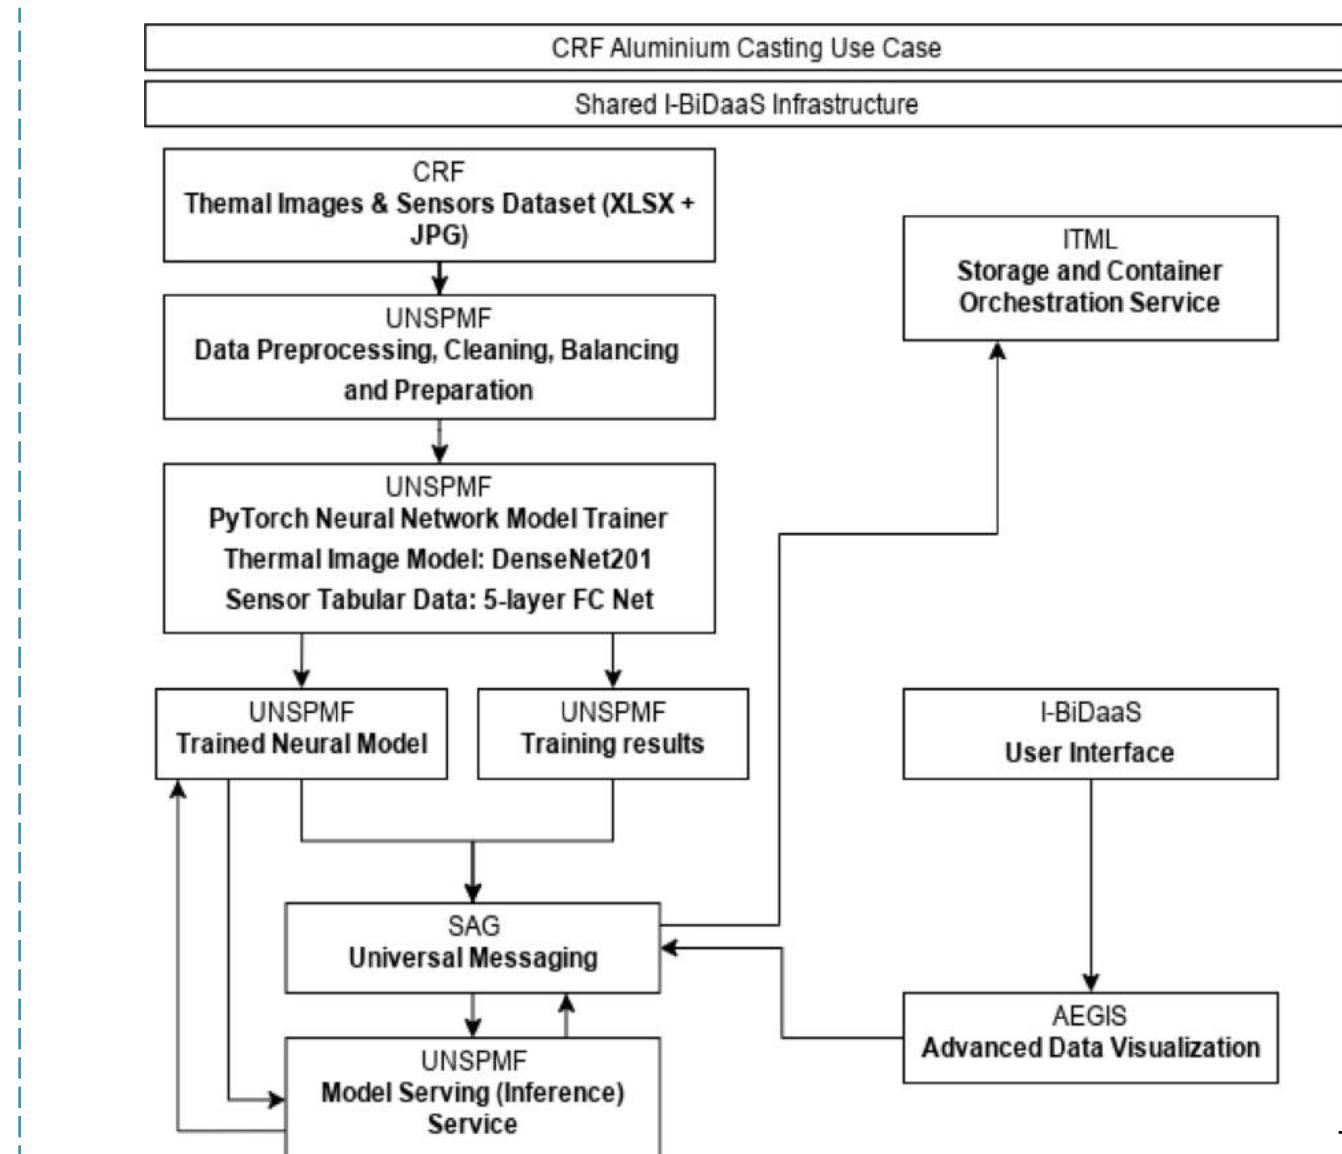

# CRF: Production process of aluminium die-casting

D3.3, D6.4

- **I-BiDaaS approach:**

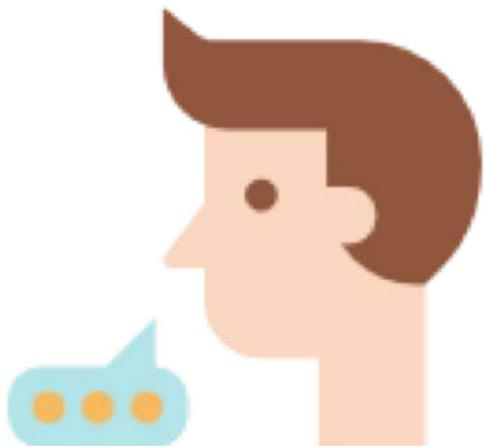

- **Joint neural network model with CNN (thermal images) and FCNN (sensor data)**
  - CNN (DenseNet201) for images – pretrained & non-trained model
  - Fully Connected NN for sensor data
- **Random under-sampling** to produce a balanced dataset
- **Good accuracy** – up to 73%

# TID: Quality of service in Call Centers

- **Call centers, example of use cases and KPIs**
  - Wide variety of the nature of phone calls: to ask for service and product information, report technical problems, to follow-up with a purchase, to provide feedback, etc.
  - Quickly get familiar and understand customer's perspective and main interests to provide fast response and improve customer service by using big data speech and language analytics.
  - Shorten call durations, waiting time and First Call Resolution (FCR) time by anticipating customer's situation based on previous insights, e.g., using the aggregation of previous analytics by Call Centers or regions.

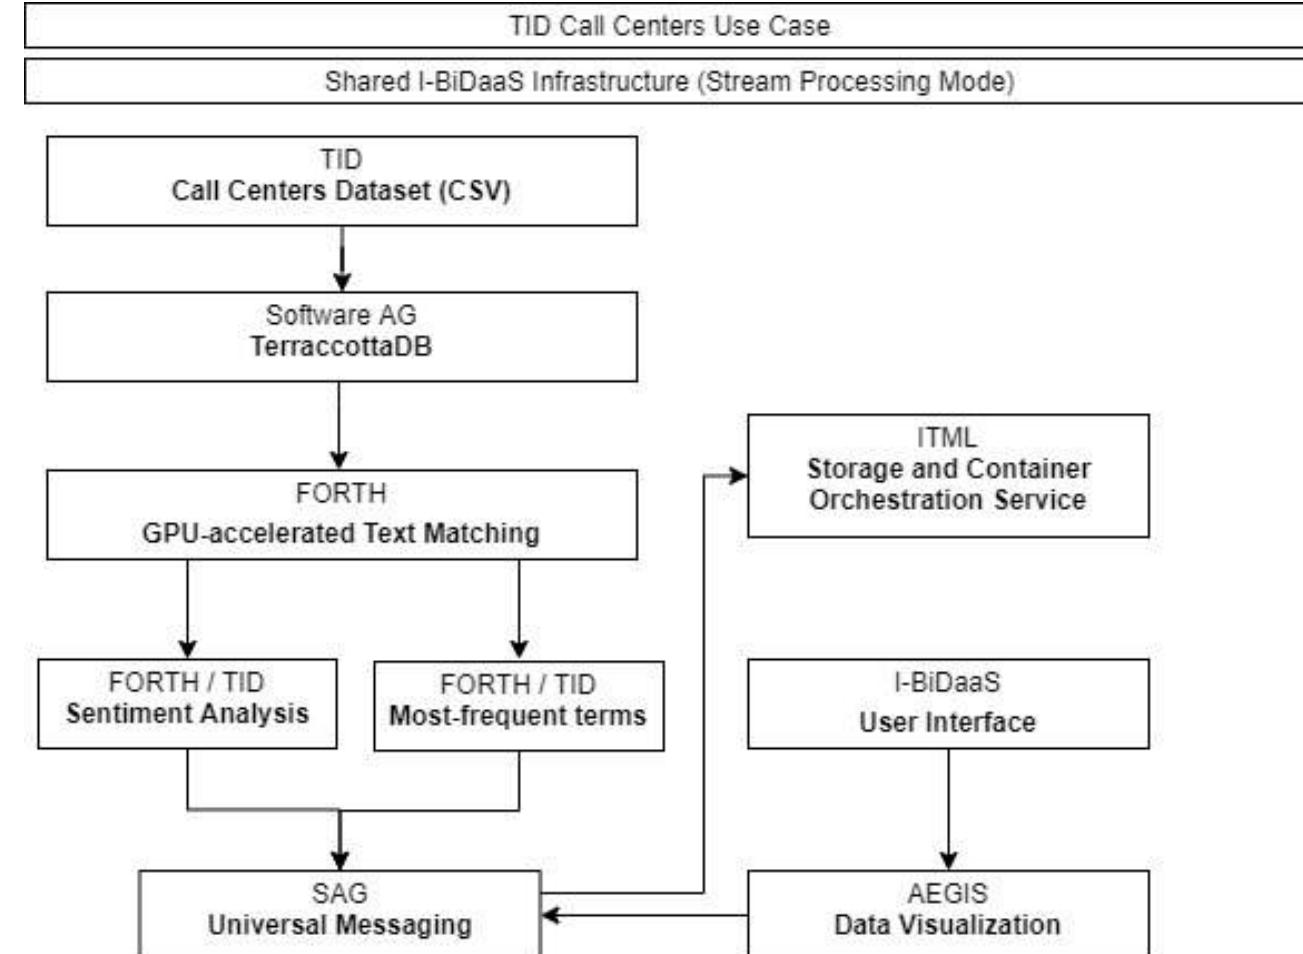

# TID: Quality of service in Call Centers

D4.3, D6.2, D6.3

- **I-BiDaaS approach**

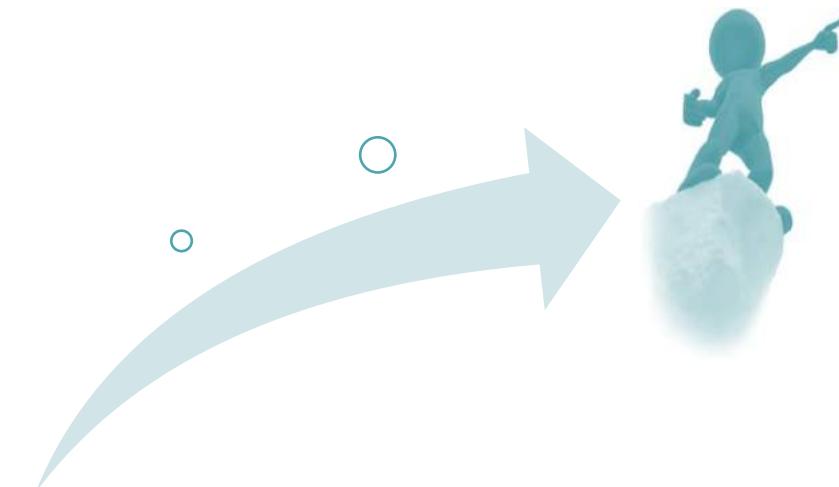

- **GPU-accelerated keywords matching** that estimates a sentiment score in the incoming data stream, aggregating them by call centers/regions and by a given time window
- Correlation between main sentiment from the calls with Customer Satisfaction Index
- Top-K frequent words or 2-grams as quick semantic overview of the CC current operation
- **High efficiency:** 42-48K calls per second

# Summary & outlook

- Open-source I-BiDaaS solution variant + User guide
- Open source scalable ML implementations  
(I-BiDaaS knowledge repository)
- Commercial platform offerings devised
- Qbeast spin-off
- Garage lab experimental platform @ CaixaBank
- Experimental training environment @ CRF
- Internal innovation call @ TID

# Industrial-Driven Big Data as a Self-Service Solution

## I-BiDaaS application to the Banking Sector

Ramon Martín de Pozuelo (CaixaBank)

I-BiDaaS Final Event

December 21, 2020

# CaixaBank and the Use of Data

CaixaBank is the **leading financial group in Spain**, both in banking and insurance and it is developing a strategy of diversification with stakes in international banks and also within leading service companies.

**+14M Customers**

**+7M On-line banking**

**+5M Mobile Banking**

**32K Employees**

**+9K ATMs**

**4.2K Branches**

In January 2014 CaixaBank created the Big Data Department.

- We currently manage more than 4PB of information only in our Big data.
- Department of more than 100 internal people providing data analytics services to all the organization.
- Due to regulation constraints all the infrastructure and the analysis is done internally.

# Why do we need I-BiDaaS?

Current data sharing situation in CaixaBank and I-BiDaaS approach

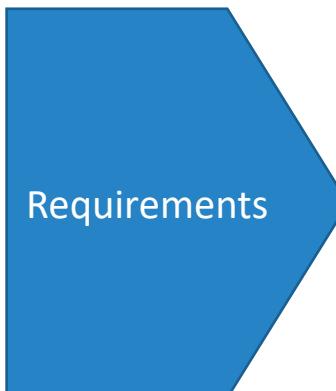

We have **tons of data** but **confidential**.

We are the data managers but the **real owners of the data are our customers**.

**Lack of agility** in our ‘Datapool’ for extracting data externally.

**Security procedures and constraints** are necessary but hinder and slow down data sharing processes.

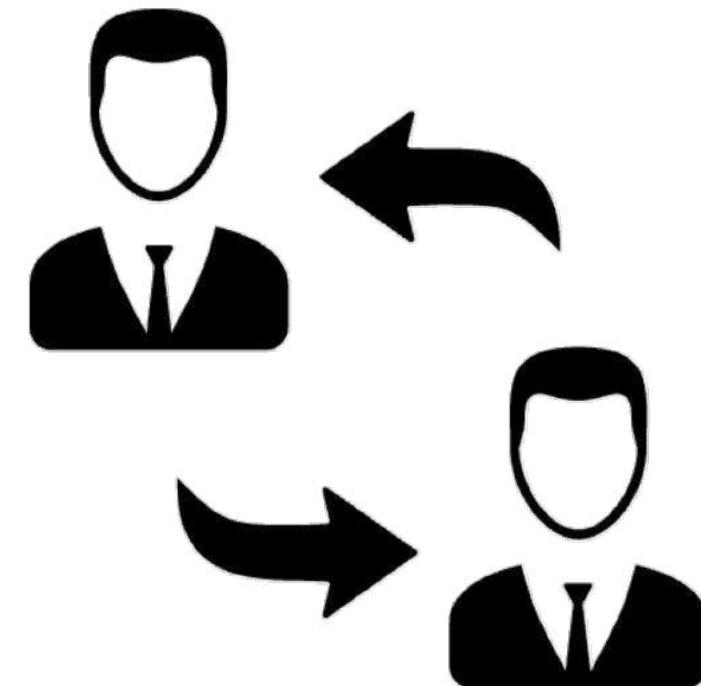

| Requirement                         | Control  |
|-------------------------------------|--|
| <b>Data privacy</b>                 | Data of customers (e.g., social graph) and external suppliers (e.g., SIEM) can not be accessed or shared with other partners |
| <b>Regulation Compliance</b>        | All activities related to CaixaBank within the project must comply with the relevant regulations (e.g., ISO 27001, GDPR)     |
| <b>Fraud and Security Analytics</b> | Use cases presented will be related to the improvement of security and the prevention of fraud.                              |

**Objective:** Exploit the I-BiDaaS platform to gain agility, efficiency and flexibility in our analytics for security.

# Why do we need I-BiDaaS?

- **Breaking external and cross-sectorial data silos while complying Regulation**
  - *Sharing Data models with other FI*
  - *Sharing Data models with other sectors*
  - *Following ECB & Banco de España constraints, we already have probed with I-BiDaaS that this is possible*

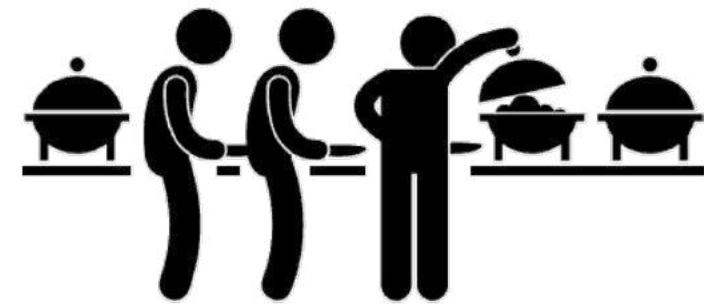

# Why do we need I-BiDaaS?

- **Secure Self- Service Infrastructure**

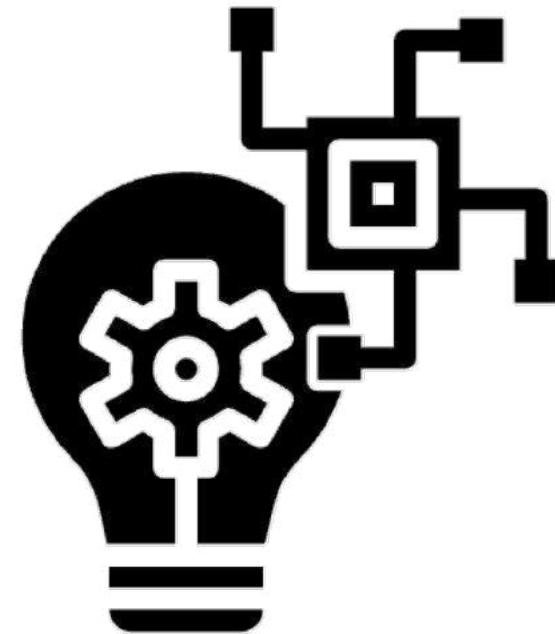

- *Being able to outsource Big Data Infrastructure preserving privacy & security*
- *To grow in a dedicated and specialized infrastructure*
- *To count on dedicated and specialized specialists*

# Why do we need I-BiDaaS?

- **Competitiveness & Innovation**
  - *Fast, agile and specialized adaptation to new technology.*
  - *Vs Current proprietary infrastructure*
- **Efficiency**
  - *Reducing the costs and time of analyzing large datasets*

# Current situation

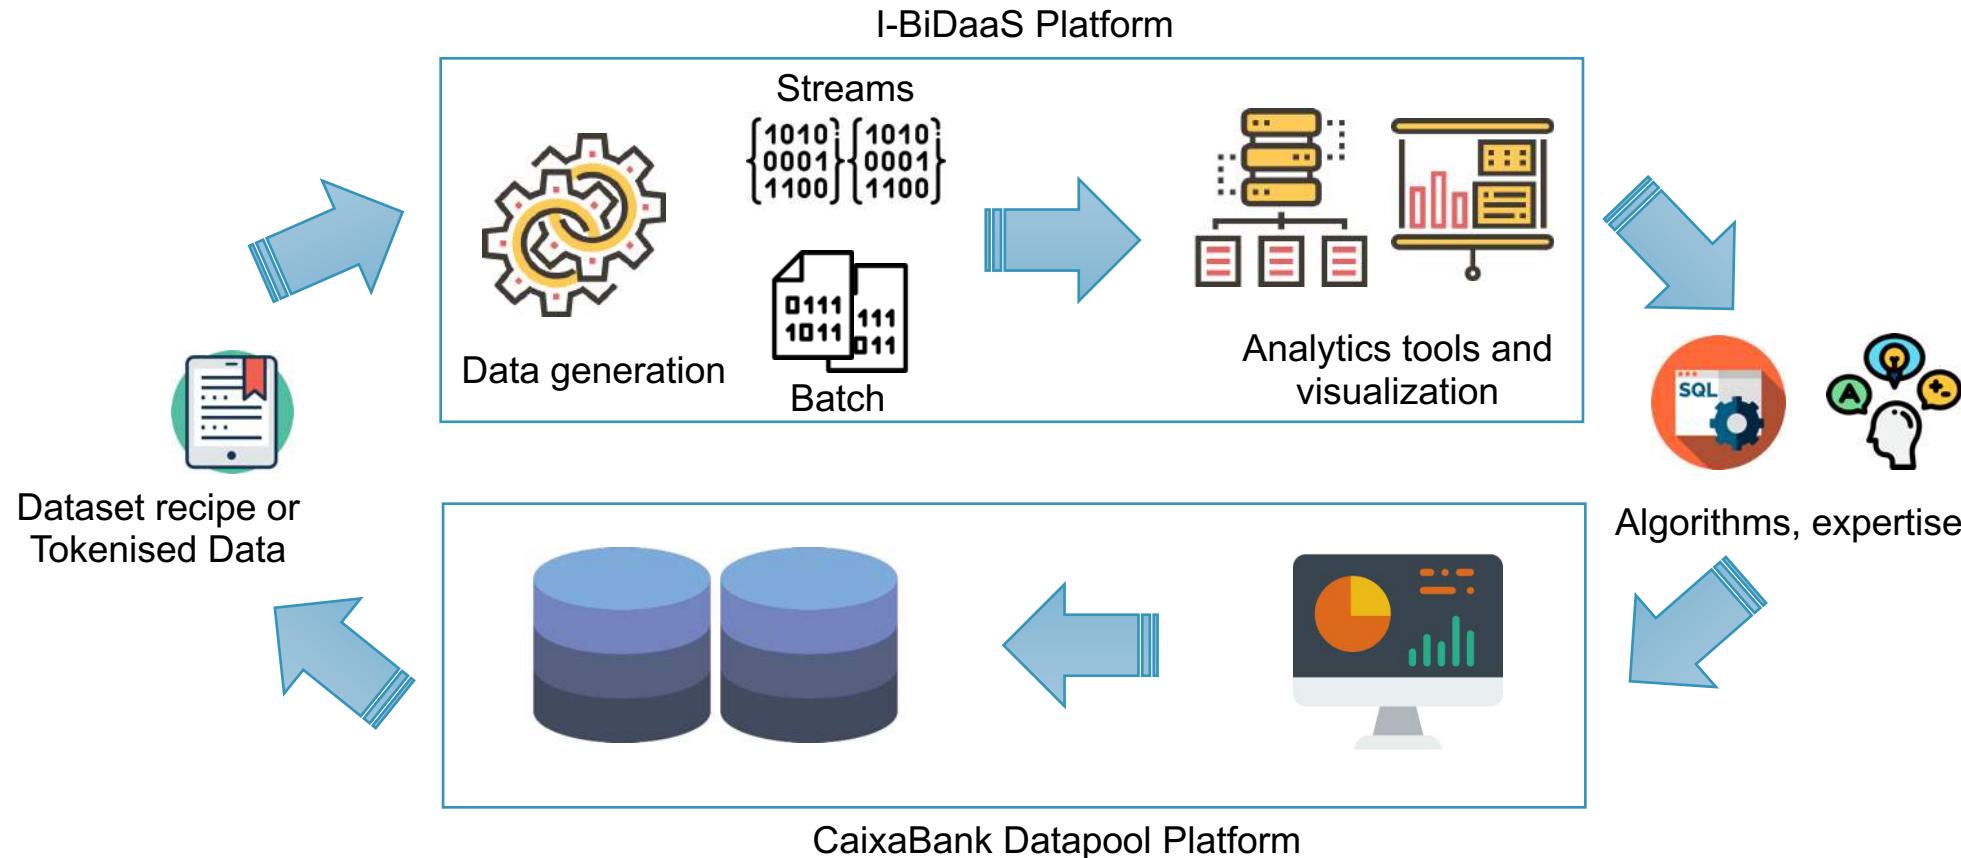

## Fraud Detection Analytics in CaixaBank

- Currently, CaixaBank data analytics are **executed in-house**.
- **Analytics lifecycle:**
  - *Security analysis data storage: DataPool (Oracle), SIEM (Devo).*
  - *Data exploration phase to build a model/query (expensive to run).*
  - *Execution of model/query on data in production mode.*
- This process is executed **periodically**.

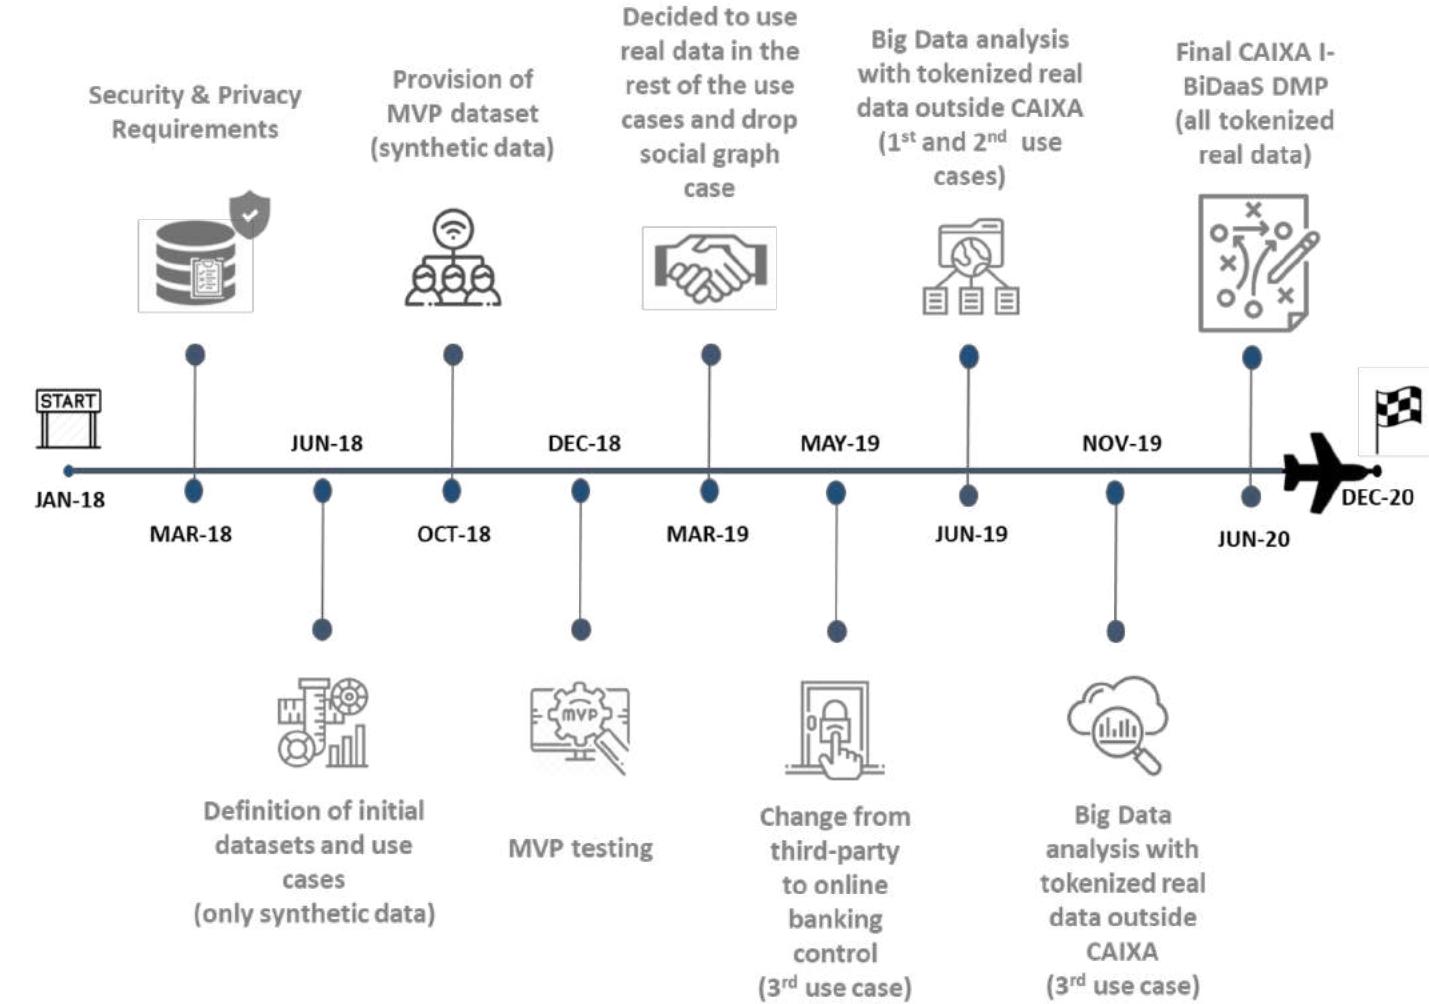

# I-BiDaaS solution

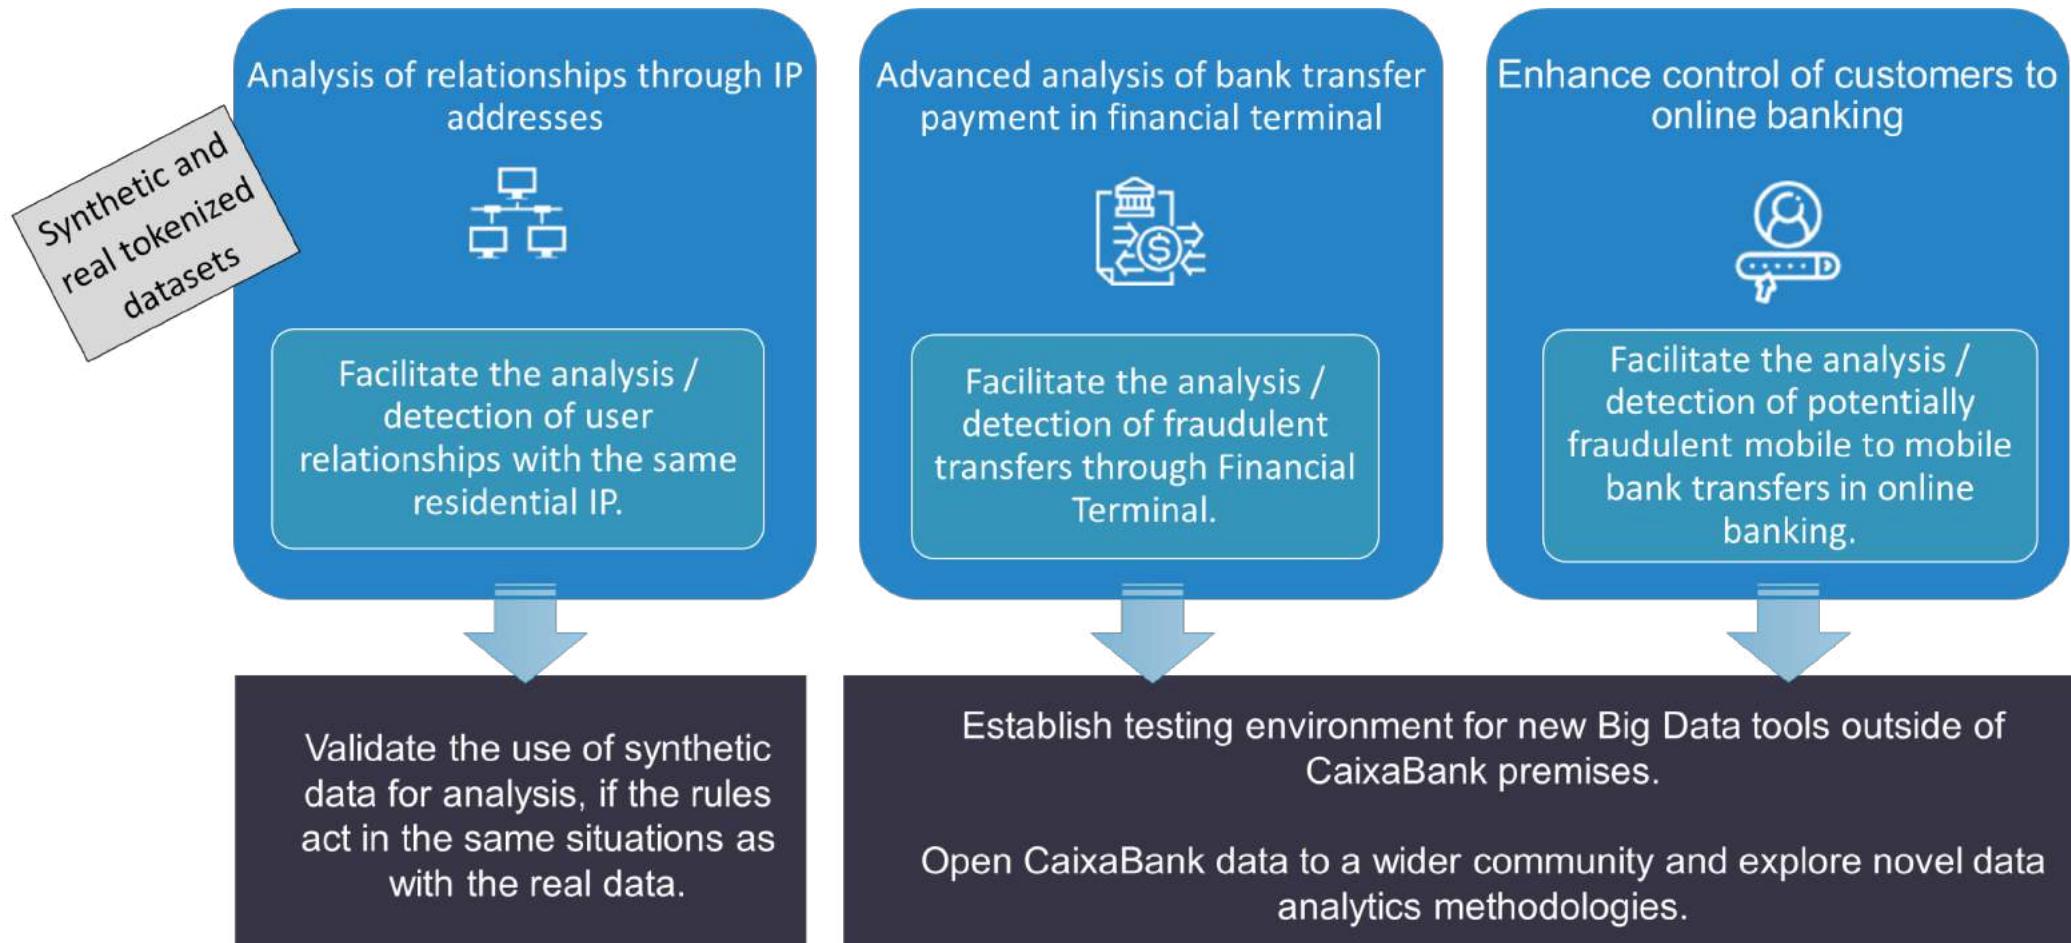

# CaixaBank Data Roadmap

- **Synthetic data usage:**
  - *We explored the synthetic data solution in the MVP.*
- **New opportunities:**
  - *The possibility to work with real data outside CaixaBank in a secure way.*
  - *We moved from totally synthetic approach to tokenized real datasets.*
  - *We include a comparison between synthetic and real data to know better the differences*

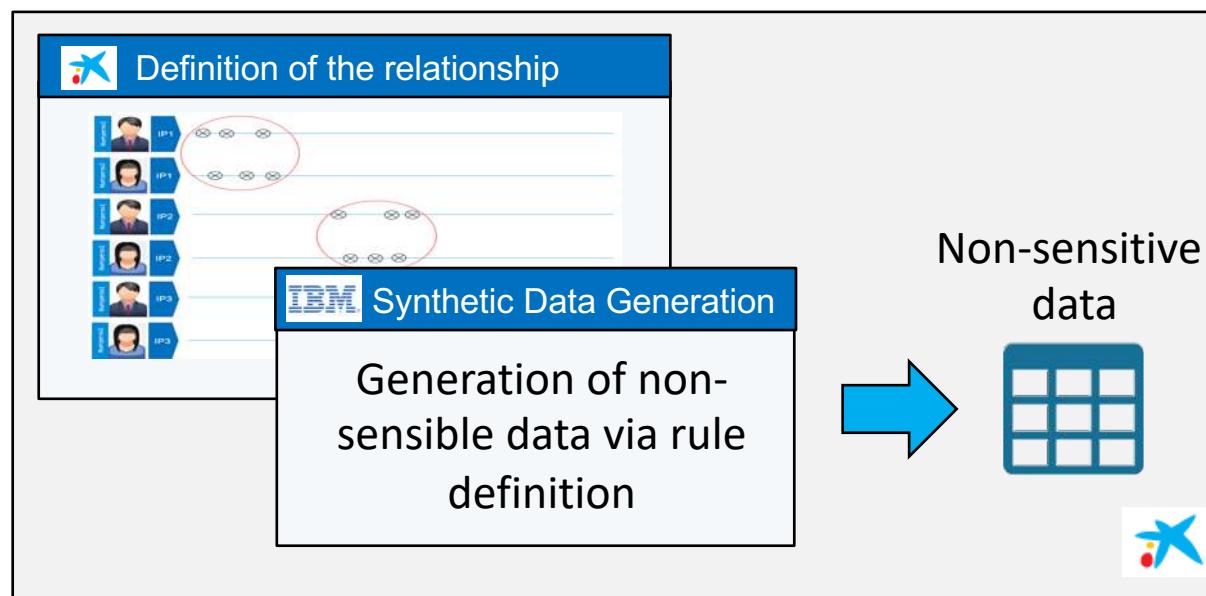

# Final Data & use cases

| Use Case   | I-BiDaaS dataset           | Data                              |
|--|----------------------------|-----------------------------------|
| Enhance control of customers to online banking                   | Online banking connections | Real tokenized                    |
| Advanced analysis of bank transfer payment in financial terminal | Bank transfers             | Real tokenized                    |
| <b>Analysis of relationships through IP addresses</b>            | IP address                 | <b>Synthetic / real tokenized</b> |

- Business Goal:**  
**The transaction between two people related by an IP is not Fraud.**
- Use Case Goal:**  
**Validation of Synthetic Data usage.**

### I-BiDaaS Use Cases

IP Address Relations -  
Batch processing

The CAIXA IP Addresses Use Case is an application of the I-BiDaaS ideas and tools extracting relations between IP addresses. In this use case batch processing of big data emerges as an innovative tool that can be instrumental in fraud detection.

IP Address Relations -  
Stream processing

The CAIXA IP Addresses Use Case is an application of the I-BiDaaS ideas and tools extracting relations between IP addresses. In this use case batch processing of big data emerges as an innovative tool that can be instrumental in fraud detection.

Centro Ricerche FIAT  
Aluminium Casting  
(Training)

The use case is concerned with the production process of aluminium casting. The goal is to use Big Data for improving the quality of the production process and operational efficiency, in particular, the quality issues on the automotive component

Telefonica CC Sentiment  
- Stream Processing

The use case is concerned with the sentiment of callers to Telefonica's call centres in Madrid, Barcellona, and Seville.

CAIXA 1st case

## MVP use case: Analysis of relationships through IP addresses

## How did I-BiDaaS help us (in this use case)?

### CAIXA 2nd case

Analyse bank transfers executed from employees financial terminal in the name of a customer.  
Potential fraudulent transfer or bad practices (e.g. check that the client was present in the time of the movement.)

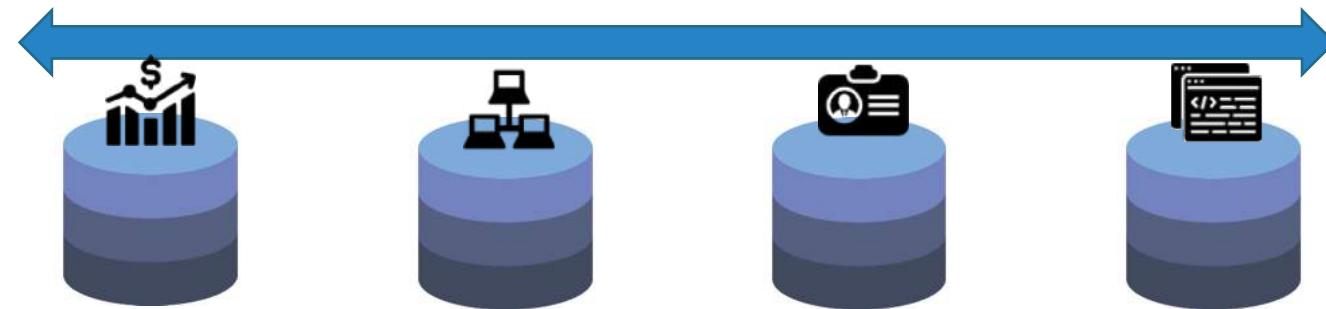

**Ensure the security of our data:**  
Decide what are we going to share **clear, tokenized or encrypted.**

The challenge relies on finding the limit of **what and how real data can be shared** to comply to regulation and not lose additional and valuable information for analytics.

**Big Data Analytics objective:** Discover fraudulent scenarios from our data by analysing the presence or not of the client.

**Use case high-level objective: Breaking internal and external silos**

- Financial Operation Data, Security Management (SIEM), etc.

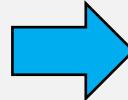

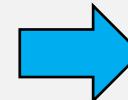

## CAIXA 2nd case

Analyse bank transfers executed from employees financial terminal in the name of a customer.  
Potential fraudulent transfer or bad practices (e.g. check that the client was present in the time of the movement.)

### CONTEXT

#### Point of view:

- Final User
- Programmer

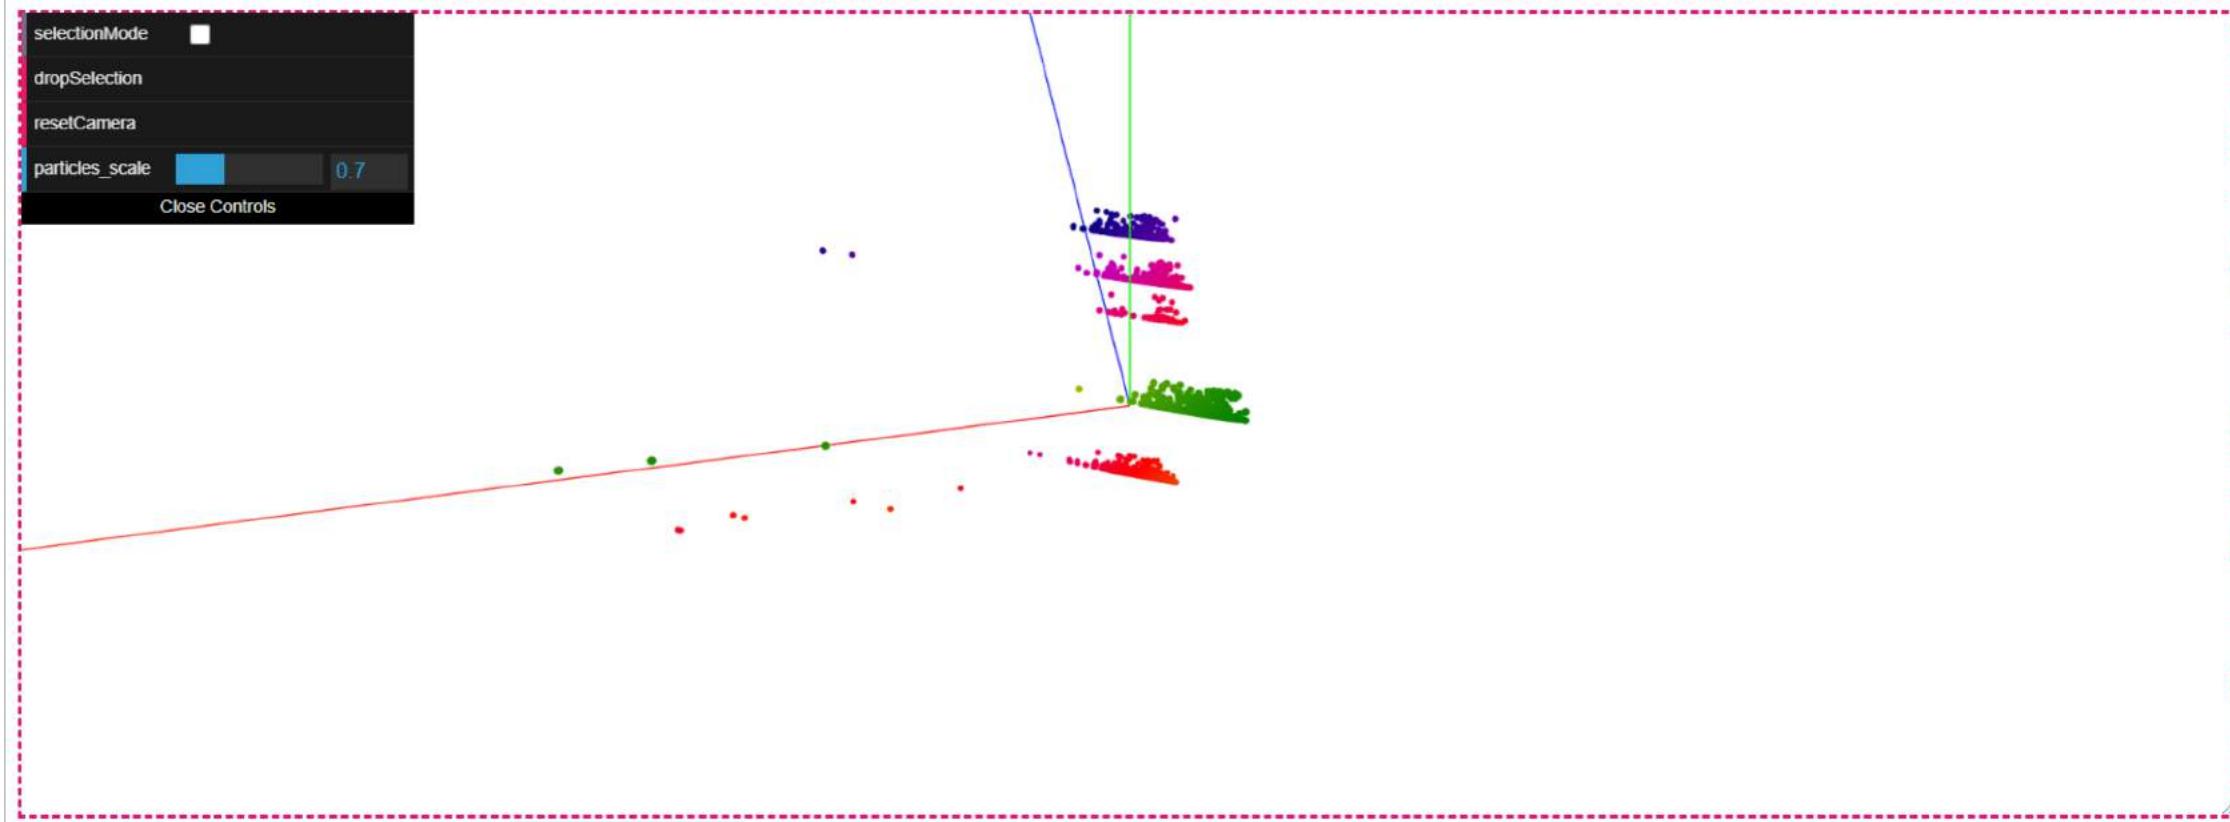

### OBJECTIVES

- Identify and glue events, followed by enriching the transfer payment dataset 
- Encrypt the data without lossing value 
- Advanced analytics 

## CAIXA 2nd case

Analyse bank transfers executed from employees financial terminal in the name of a customer.  
Potential fraudulent transfer or bad practices (e.g. check that the client was present in the time of the movement.)

## CAIXA 2nd case

Analyse bank transfers executed from employees financial terminal in the name of a customer.  
Potential fraudulent transfer or bad practices (e.g. check that the client was present in the time of the movement.)

## DataRobot comparison results

- ***Custom solutions:***
  - I-BiDaaS provide more flexibility in the definition of your own code, scoring metrics, etc.
- ***Unsupervised learning:***
  - DataRobot has very limited number of unsupervised learning models. I-BiDaaS can provide much more detailed results on unsupervised learning use cases.

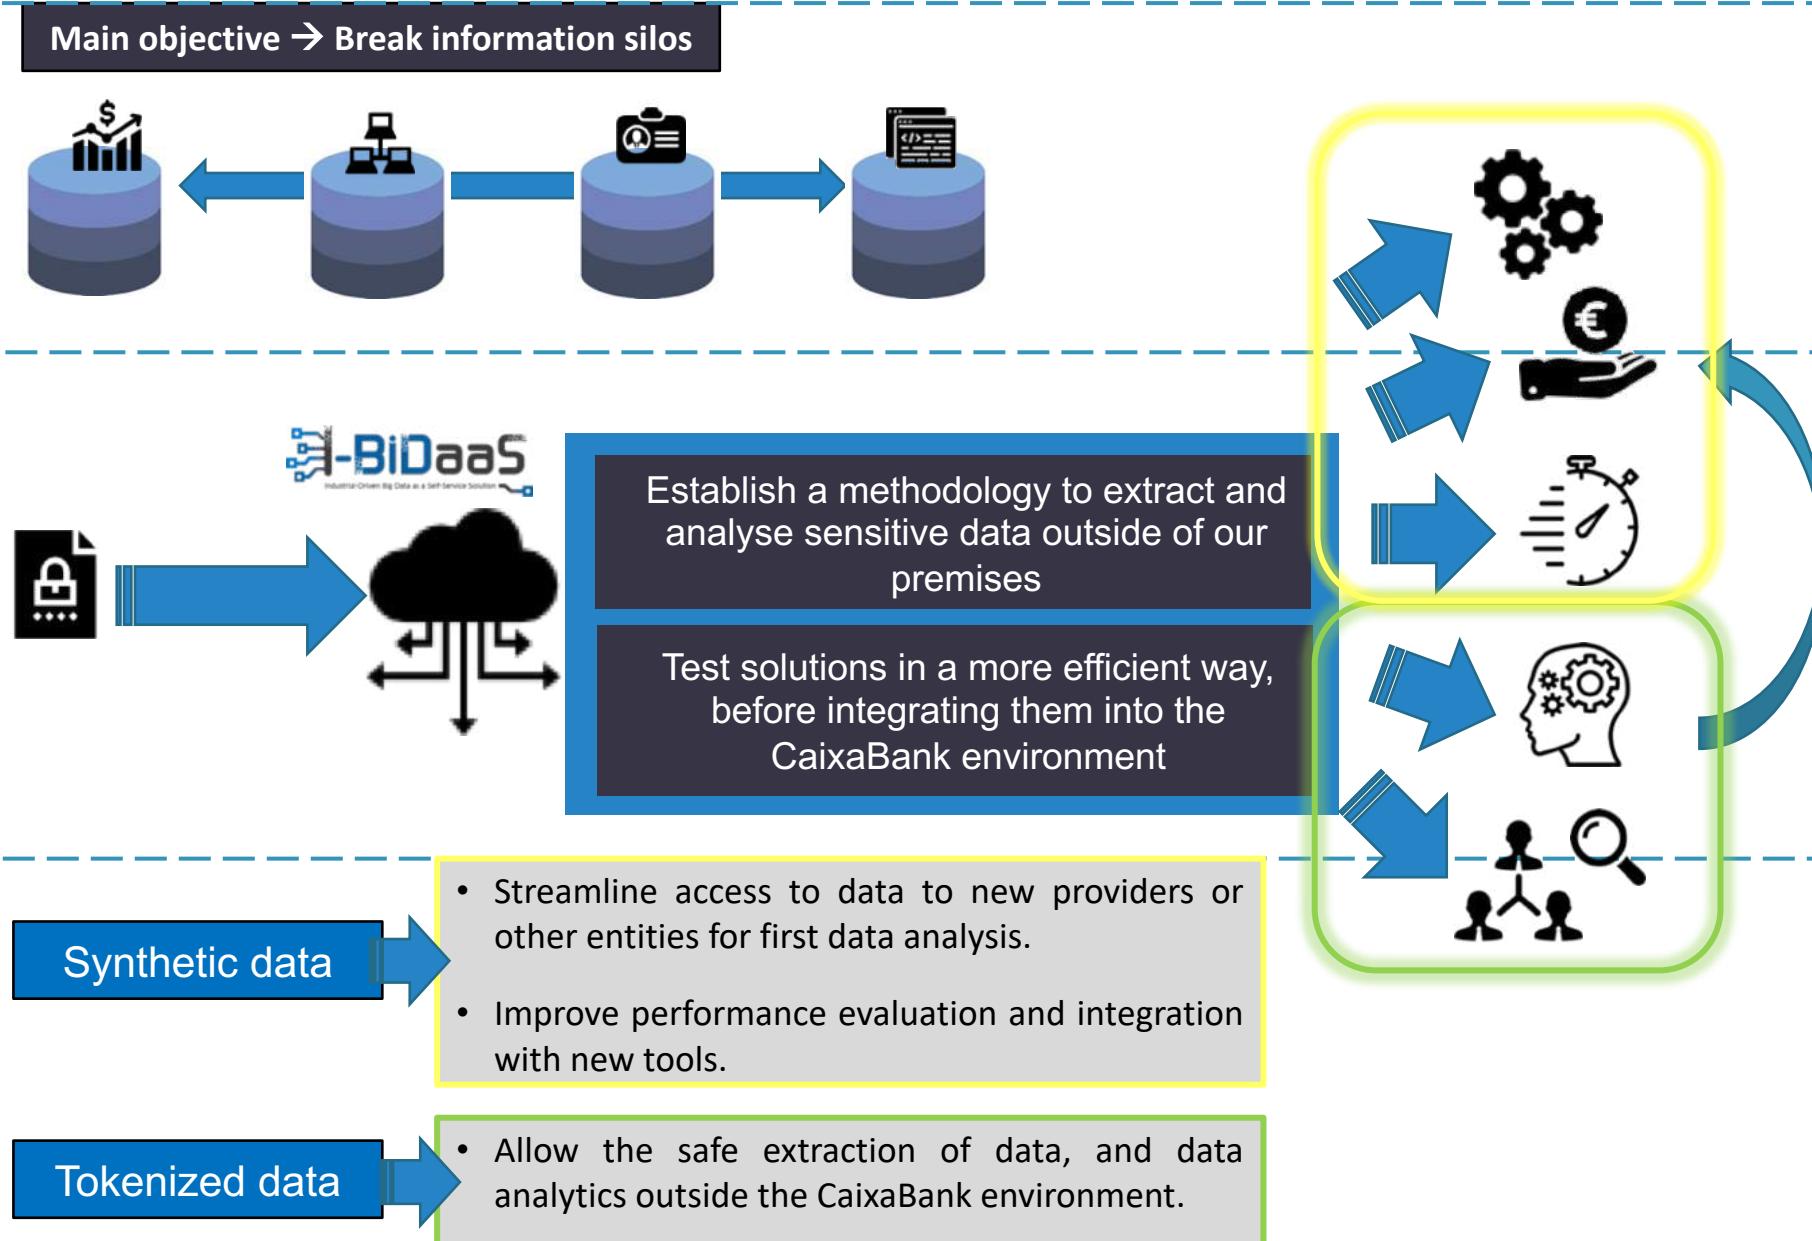

## 3rd use case

Analyse the patterns on mobile to mobile bank transfers and identify clusters of transfers with higher risk.

# Lessons Learned: How did I-BiDaaS help us?

# Lessons Learned: CaixaBank benefits from I-BiDaaS

| Benefits  | KPIs  |
|---|---|
| To increase the efficiency and competitiveness in the management of its vast and complex amounts of data.                             | 75% time reduction data access from external stakeholders using synthetic data (From 6 to 1.5 days).      |
| To break data silos not only internally, but also fostering and triggering internal procedures to open data to external stakeholders. | Real data accessed by at least 6 different external entities skipping long-time data access procedures.   |
| To evaluate Big Data analytics tools with real-life use cases of CaixaBank in a much more agile way.                                  | I-BiDaaS overall solution and tools experimentation with 3 different industrial use cases with real data. |

# Telefonica Research I-BiDaaS Final Event

**Ioannis Arapakis**  
(PhD)

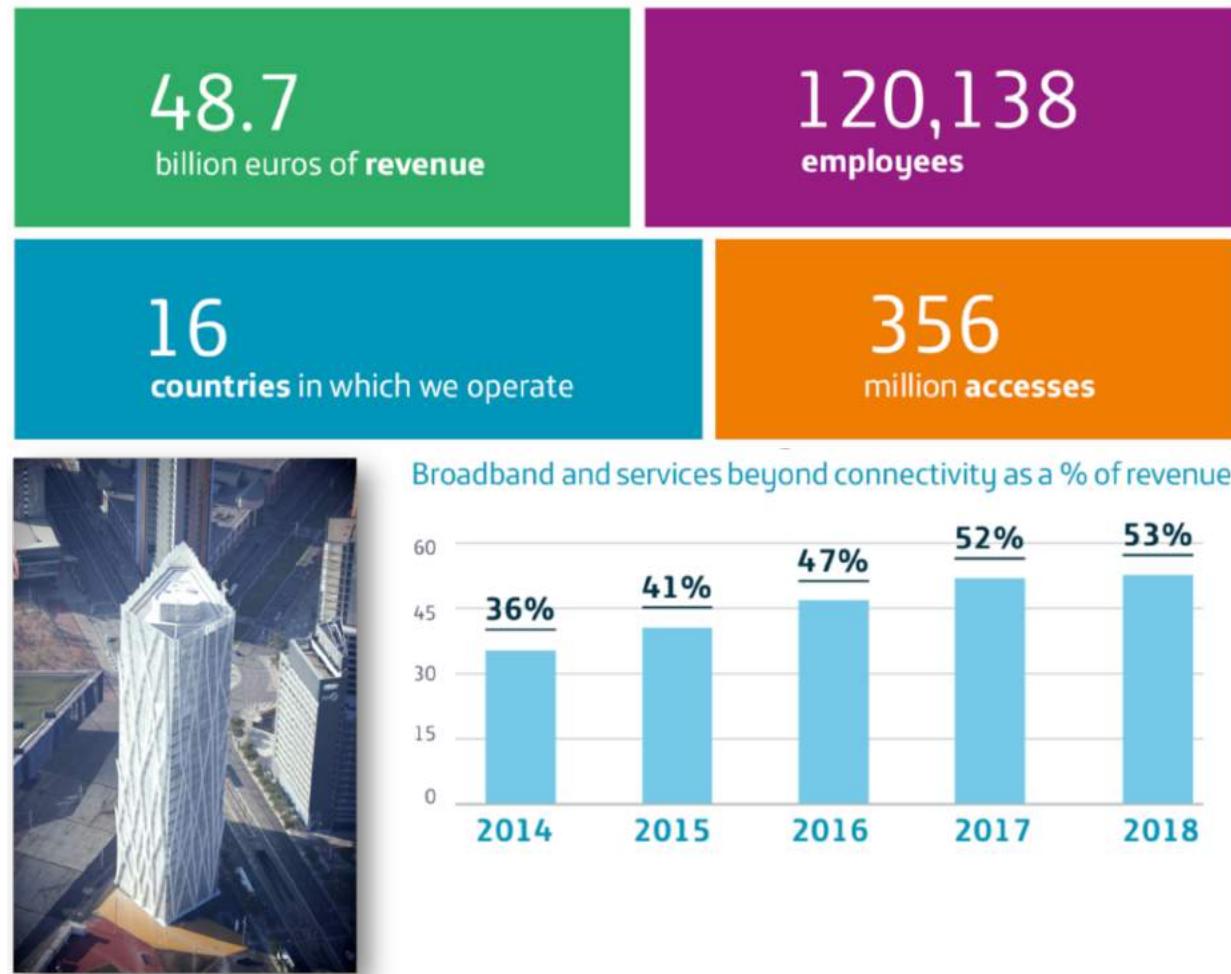

**Jordi Luque Serrano**  
(PhD)

*Telefonica*

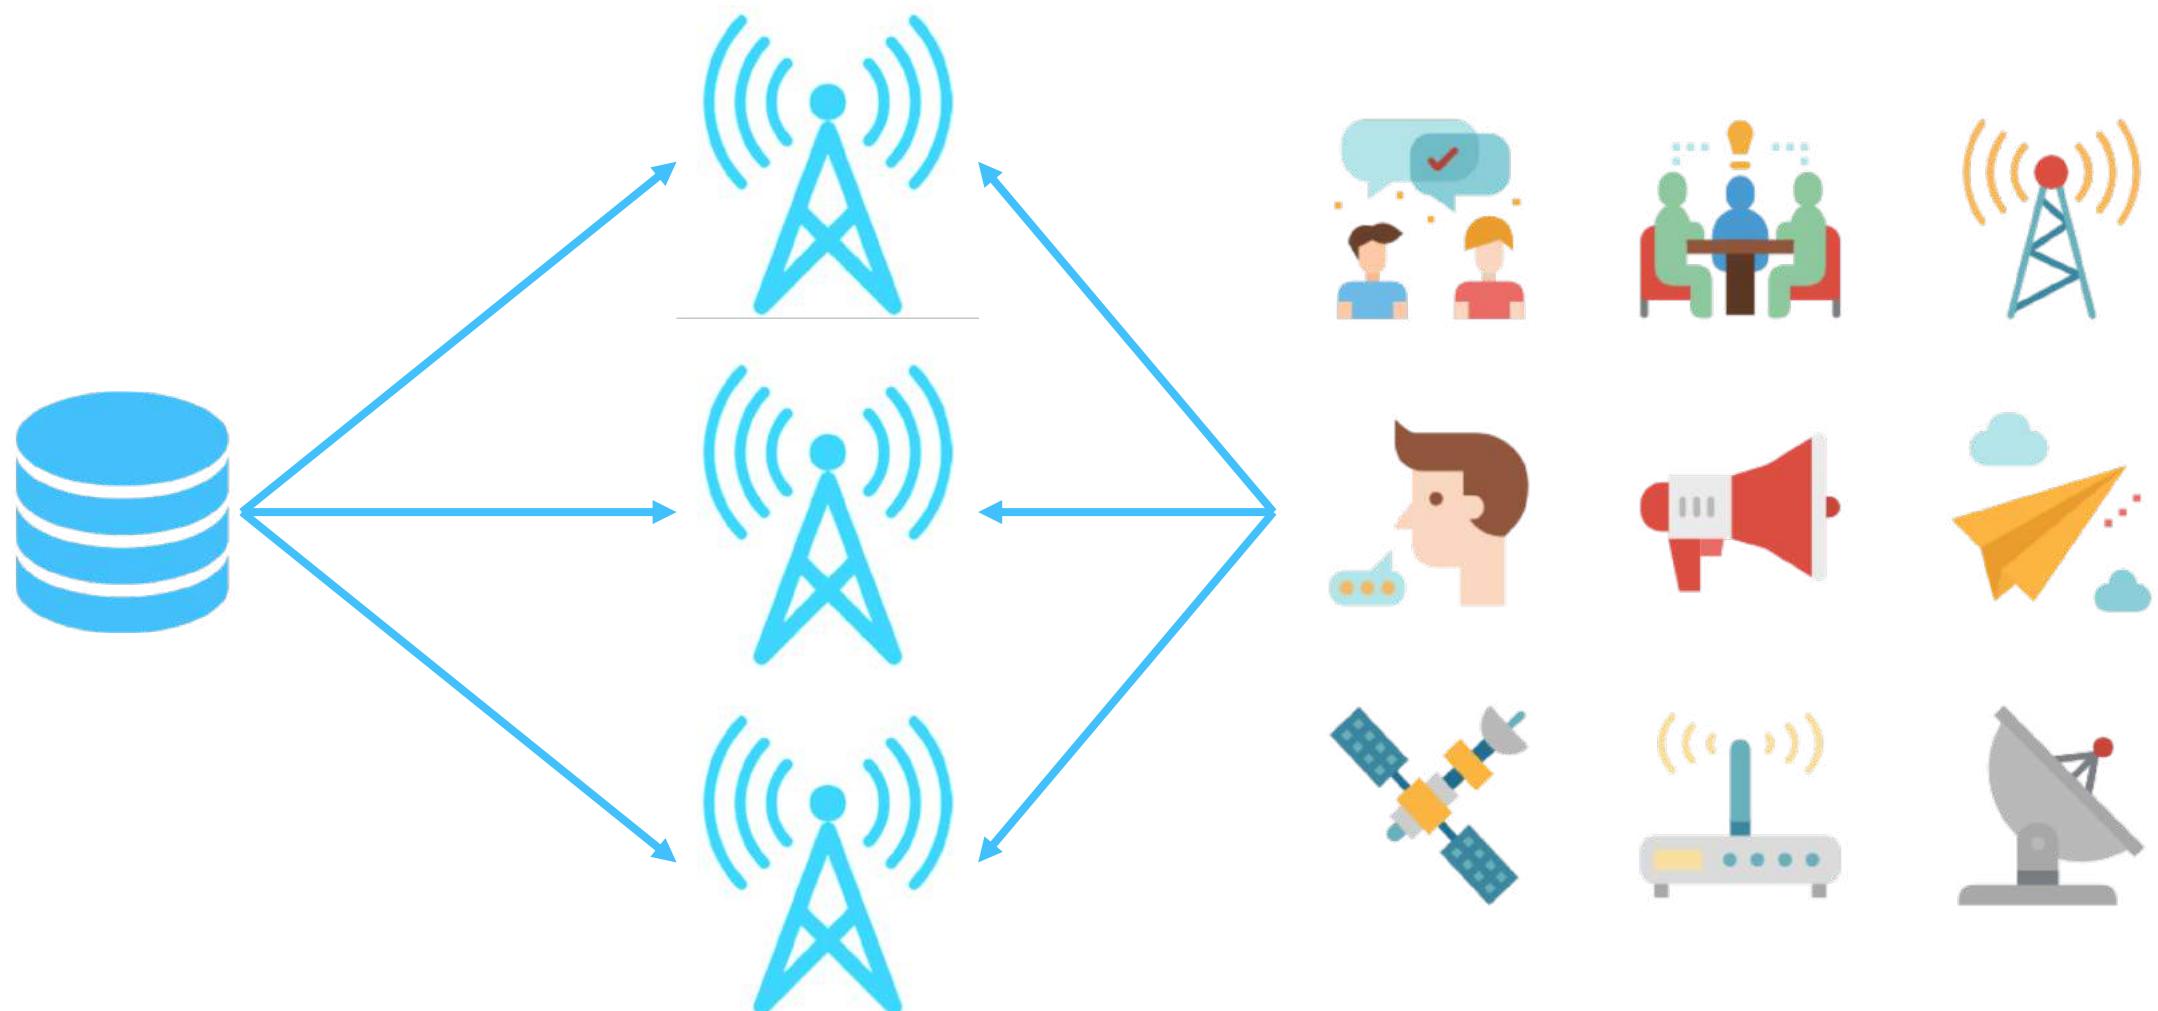

# Overview of TID

# Telefonica in Numbers

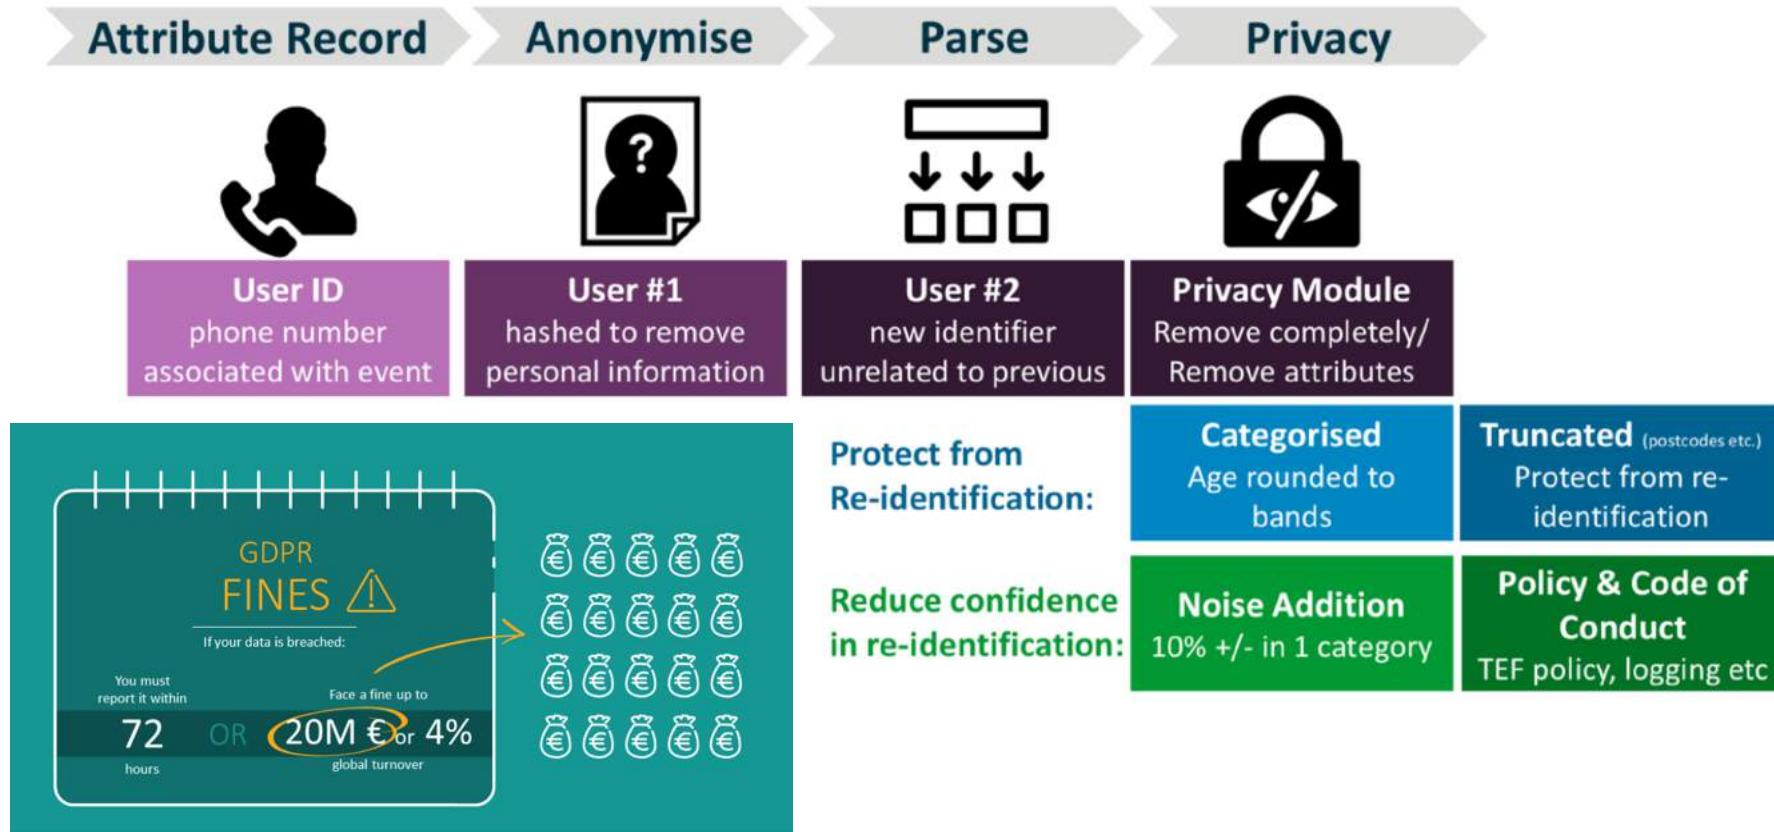

- Telefonica is one of the largest telecommunications companies in the world by market capitalization and number of customers
- It provides quality of connectivity that is delivered over world class fixed, mobile and broadband networks

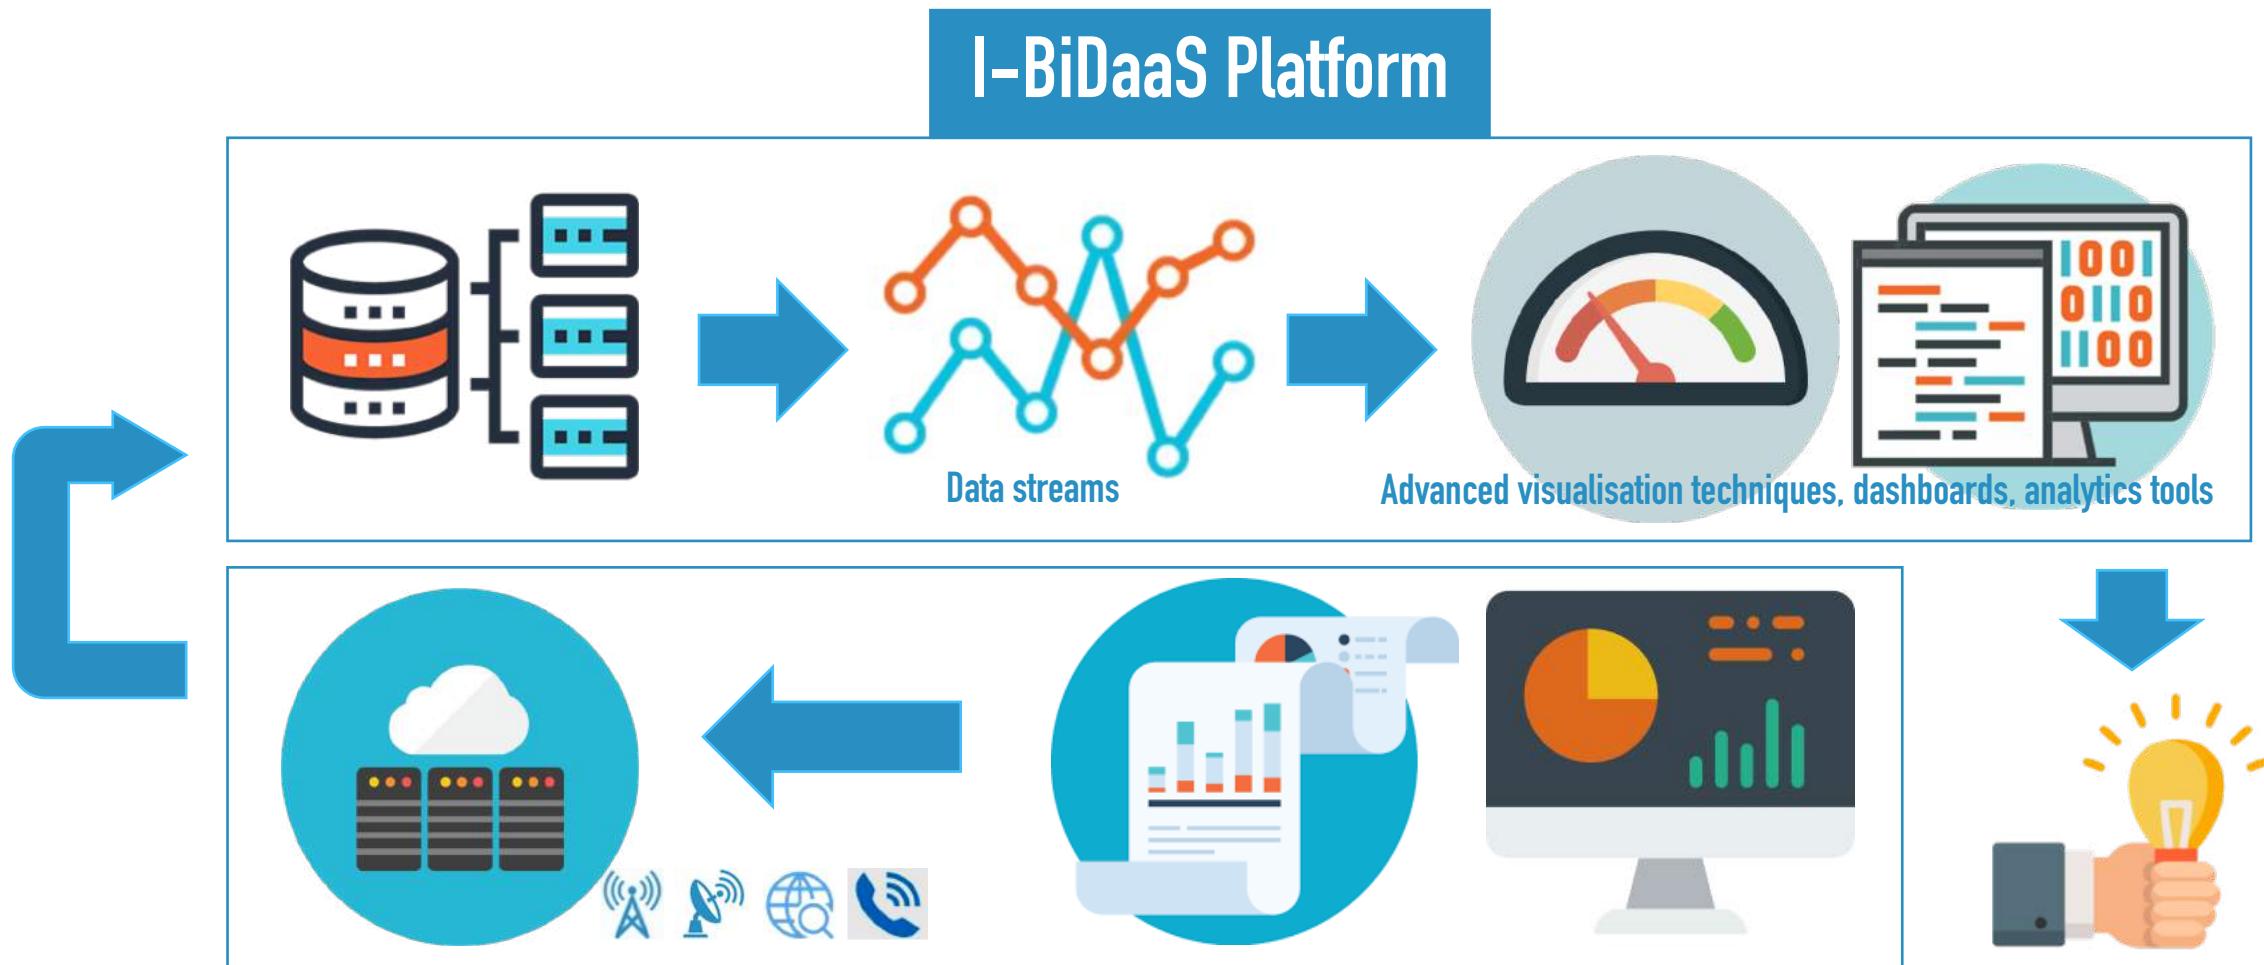

# Data Landscape

# Industrial Challenges

# The I-BiDaaS Solution

# TID Use Cases

## Quality of Service in Call Centers

Improve performance of CC operations by automatically processing audio calls and predicting customer satisfaction index

## Optimization of placement of telecommunication equipment

Improve routing and placement of antennas

## Accurate location prediction with high traffic and visibility

Enable the automatic extraction of behavioural patterns of customers

# Quality of Service in Call Centres (CC)

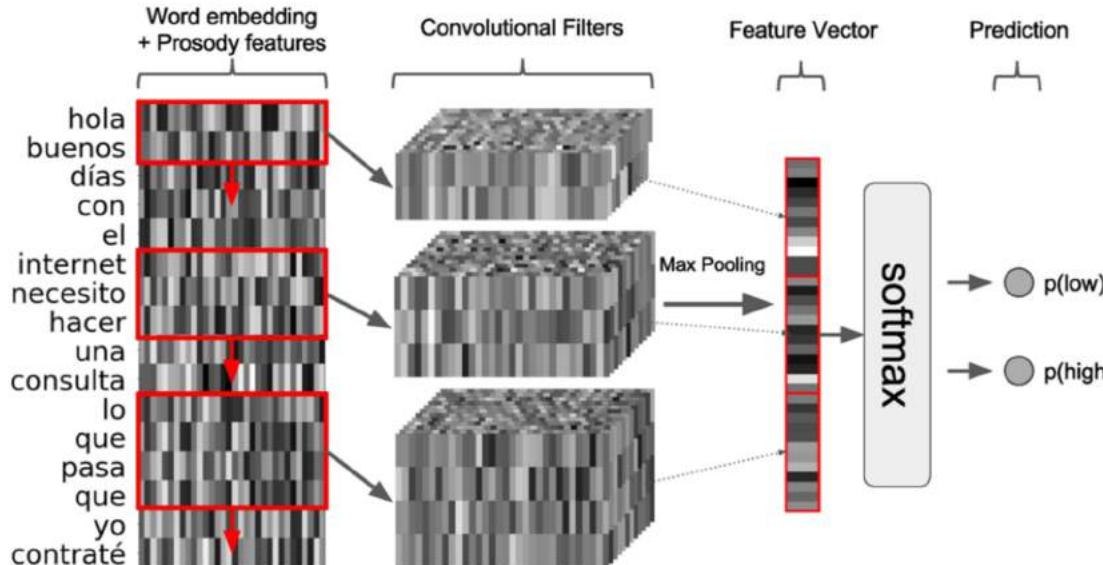

# Use Case Requirements

- Nature of phone calls varies greatly
- Quickly get **familiar** and **understand** customer's perspective to provide fast response and improve customer service by using big data speech and language analytics
- Shorten call durations, waiting time and **First Call Resolution (FCR) time** by anticipating customer's situation based on previous insights, e.g., using the aggregation of previous analytics by Call Centers or regions
- Detect **customer satisfaction** based on the automatic transcript analysis

# Data

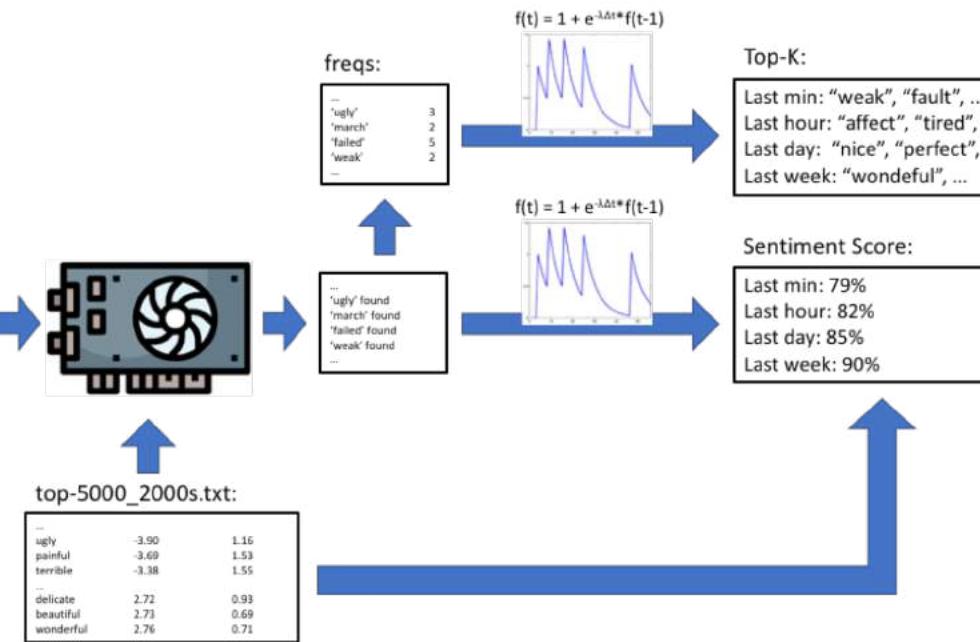

- Anonymised dataset with 1.3M transcripts, that is, around 12.3 years of continuous speech recordings
- Analyzed the significance of various acoustic features extracted from customer-agents' spoken interaction in predicting self-reported satisfaction
- Investigated whether speech prosodic features can deliver complementary information to speech transcriptions provided by an ASR

# Predictive Modeling

| CNN                    | 0.605 (0.212)          | 0.759 (0.410)        |
| CNN + prosody          | <b>0.733 (0.242)</b>   | <b>0.772 (0.427)</b> |

# KPIs

- No **automated solution** in place; customer audio calls are processed by human agents (Business Units inspect <1% of total calls per year) which is a **costly** and **time-consuming** solution

| Existing Solution   | I-BiDaaS Solution  |
|---|--|
| <b>~11,520</b> calls processed (per year) by human agents                                       | <b>~3.5B</b> calls processed per year in a single GPU<br>Max. real-time throughput: <b>40K transcripts/second</b><br>(I-BiDaaS platform)                 |
| This manual process allows to identify about <b>2,300 low customer satisfaction audio calls</b> | Increase the number of detected low customer satisfaction calls by human agents to <b>7,000 (200% increase*)</b> by ranking the calls based on sentiment |

# Intelligent Dashboard

# Accurate Location Prediction with High Traffic and Visibility

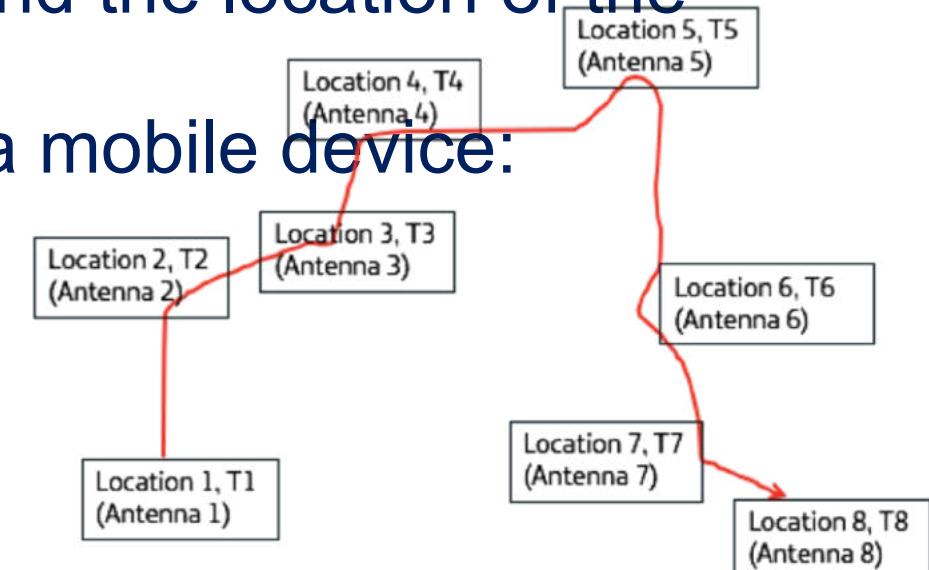

# Use Case Requirements

- Predict places with **high traffic** and **congestion** events in order to optimise their resource distribution
- Important challenges that stem from this use case:
  - Interpolate missing events to recover plausible event trajectories
  - Minimize processing time with respect to growing data size
  - Maintain real-time delivery of results

# Data

- Our dataset consists of **synthesized** traces mimicking cellular network events
- Each trace is a time series of mobile events that contain the encrypted user identifier, a timestamp, and the location of the associated base station
- A mobile event is generated every time a mobile device:
  - activates/deactivates in the network
  - makes/receives a call
  - sends/receives an SMS
  - moves from one location area code to another
  - changes from one technology to another
  - requests access to data (2G/3G) or requests a high-speed data channel (4G)

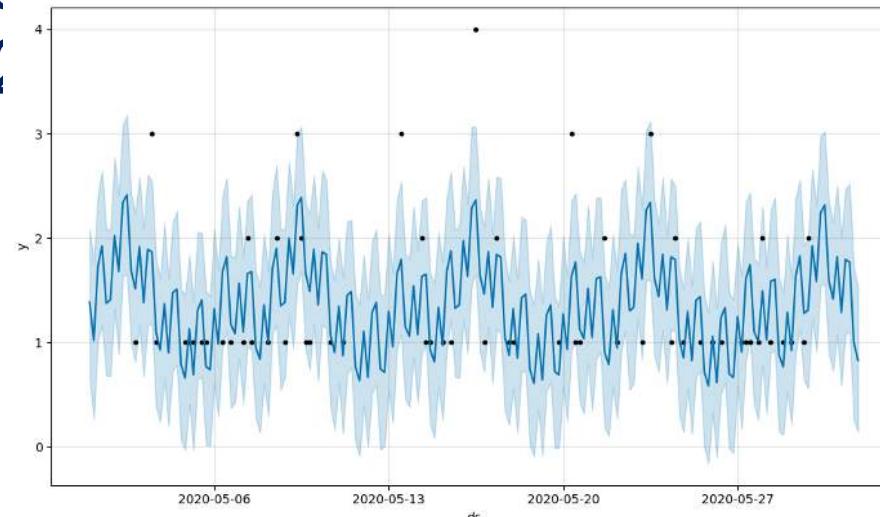

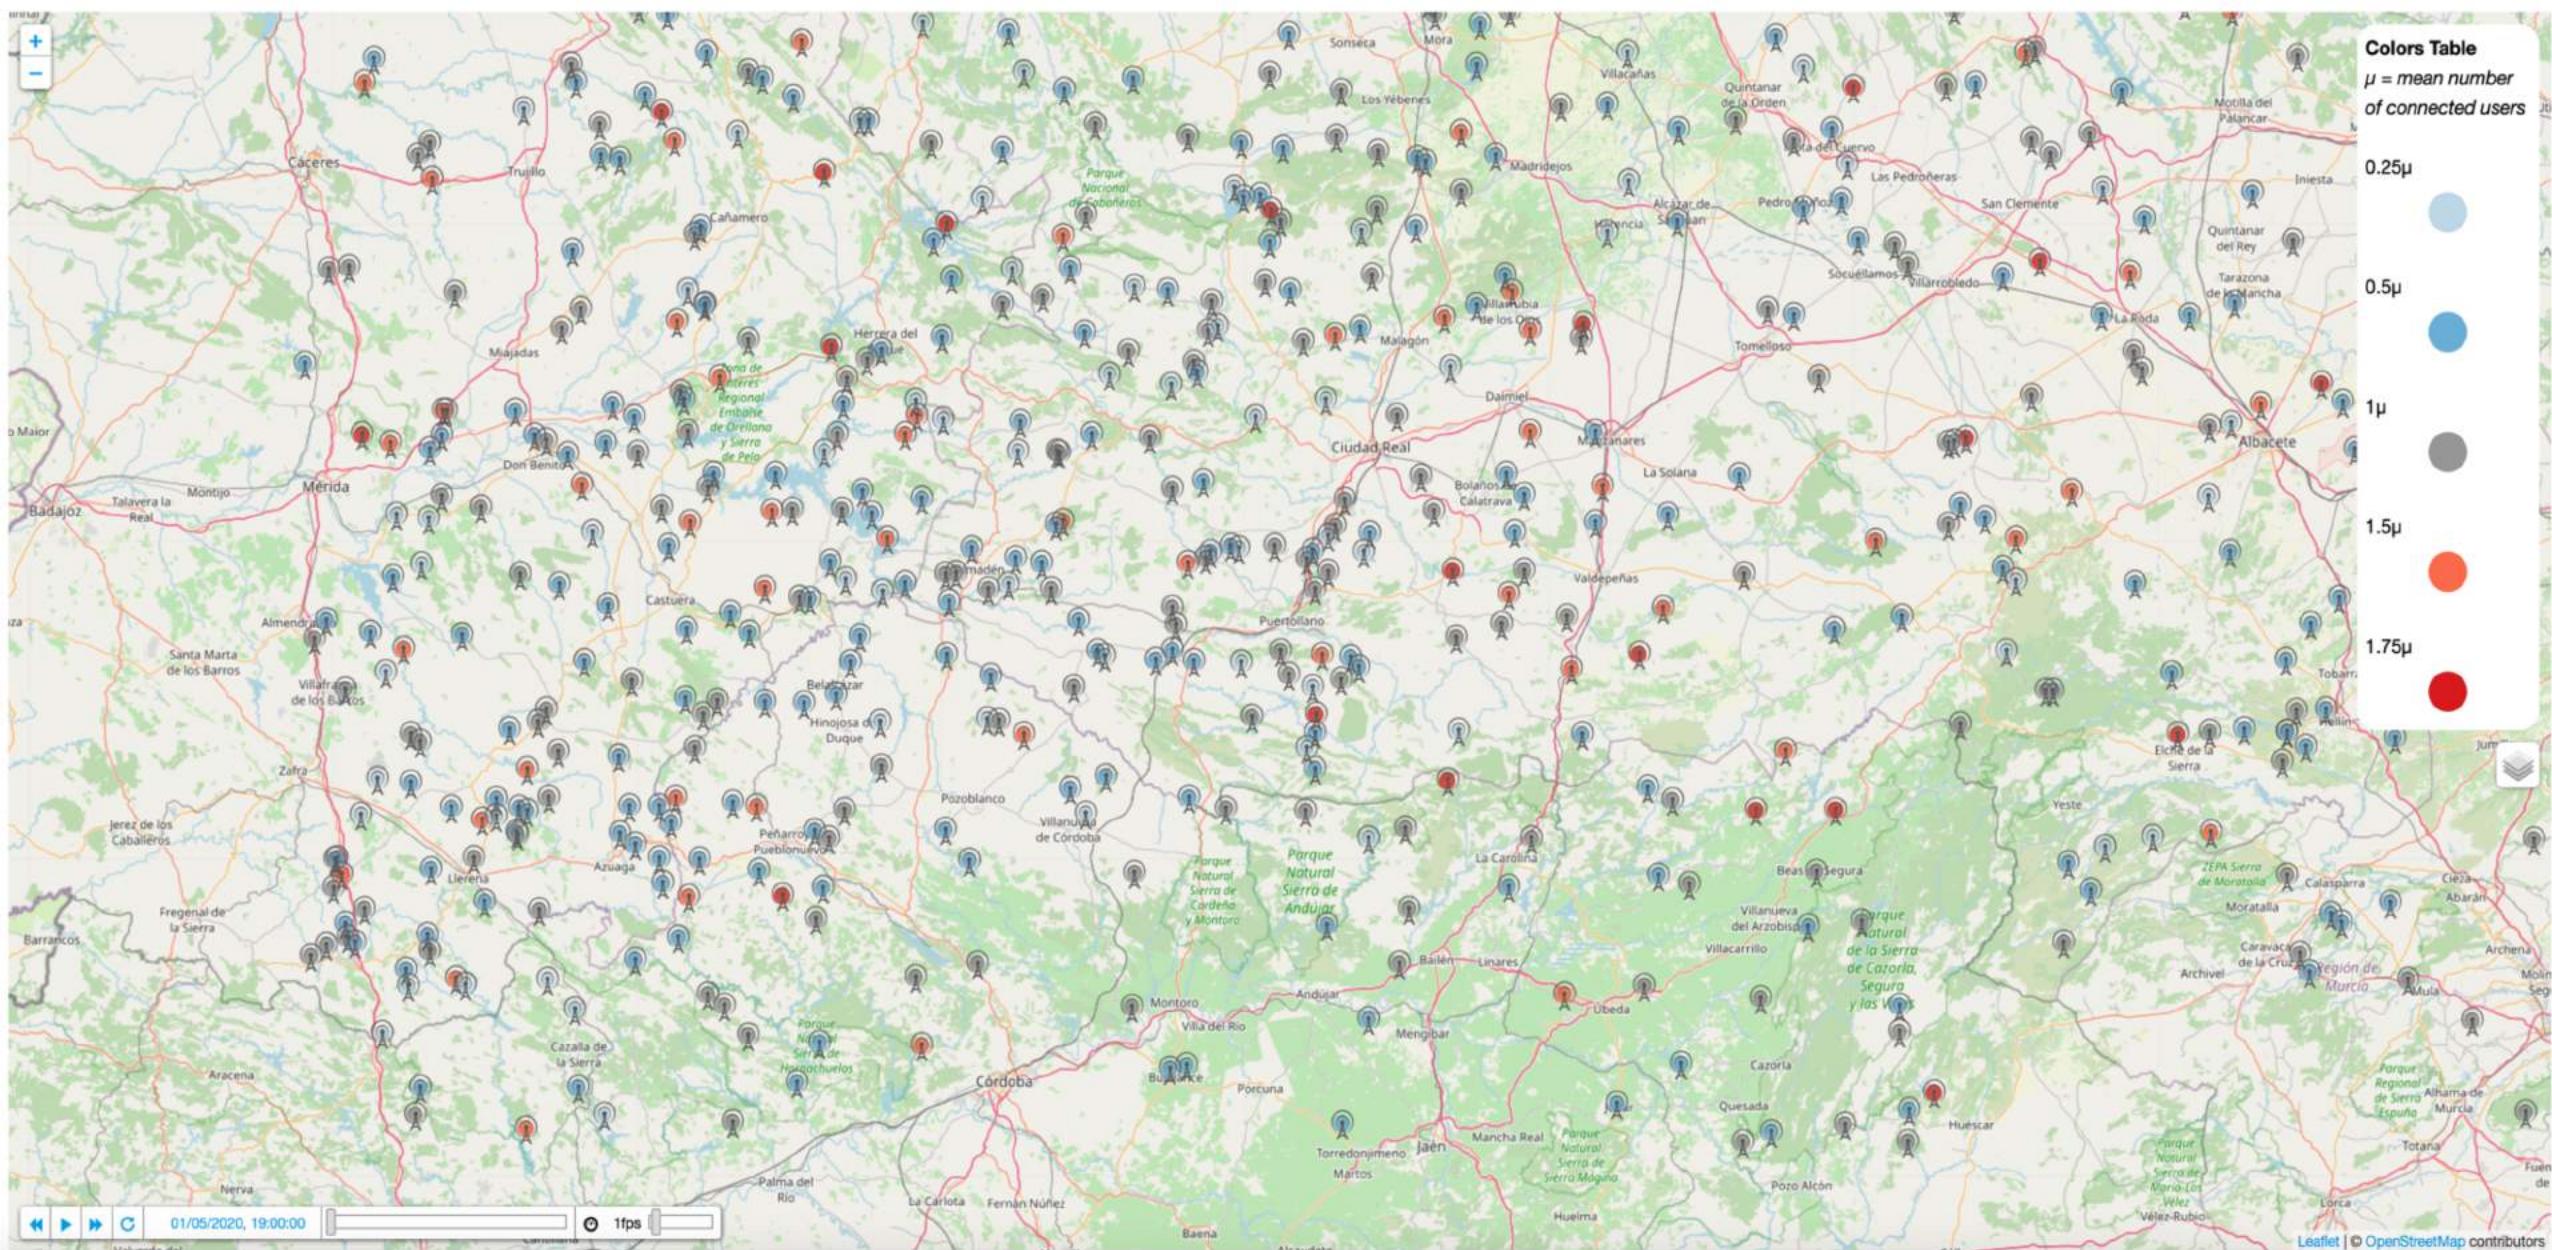

# Predictive Modelling

- We want to predict movement from one sector to another
- Estimate the delta (%) in connected users per sector x hours in advance
- The forecasting model can account for:
  - Information about the other sectors' current status and load
  - Contextual data, such as the weather for the location
  - Occurring events (holiday events or other)

# KPIs

- We used process-based parallelization where every CPU core was assigned a process which trained a time series model for one antenna
- Training ~120K time series took three (3) hours on the TID server
- We selected the best 100 models based on the mean average error (we obtained a baseline metric of the average mean absolute error of 1.2)

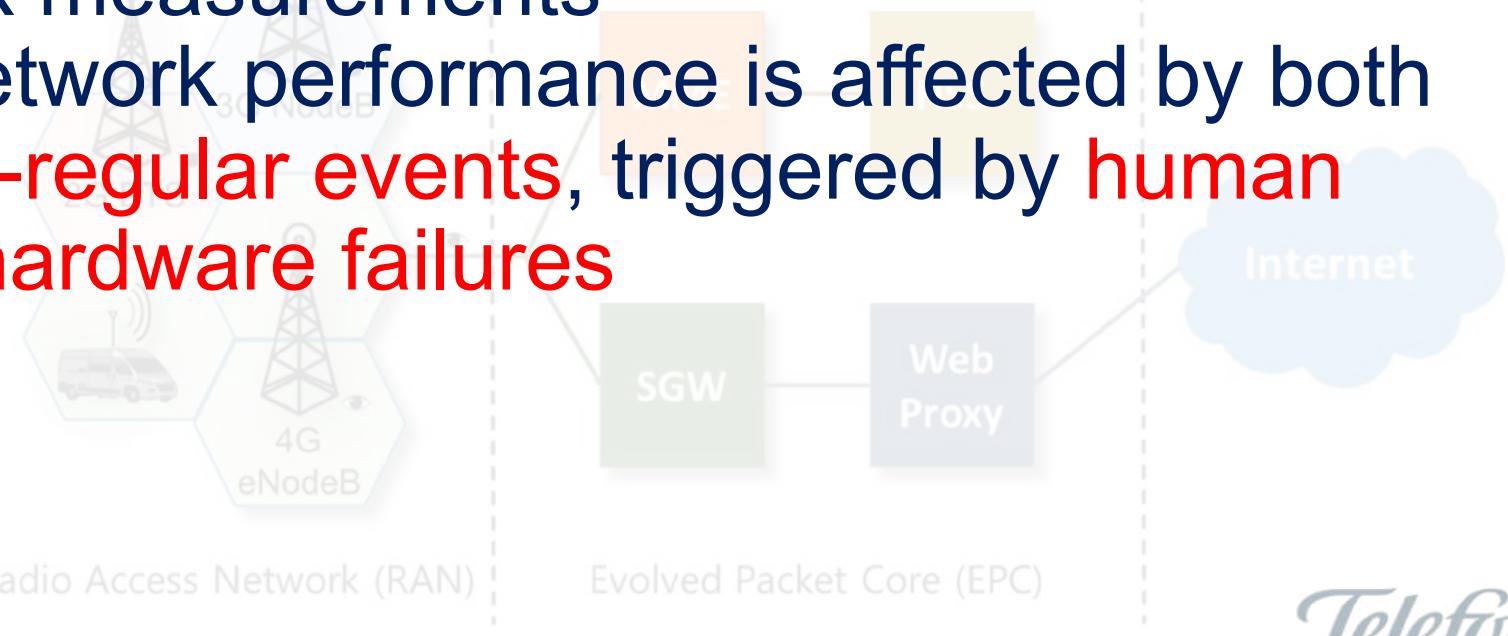

Highlight Antennas Below  $\mu$  Highlight Antennas Above  $\mu$  Highlight All AntennasAdjust Opacity: 

# Optimization of Placement of Telecommunication Equipment

# Use Case Requirements

- To manage and maintain large-scale cellular networks, MNOs need to monitor **constantly** cellular network performance, which is a **non-trivial task**
- The so-called **hotspot score** is computed based on multiple network measurements
- However, the network performance is affected by both **regular** and **non-regular events**, triggered by **human behaviour** and **hardware failures**

# Current Limitations

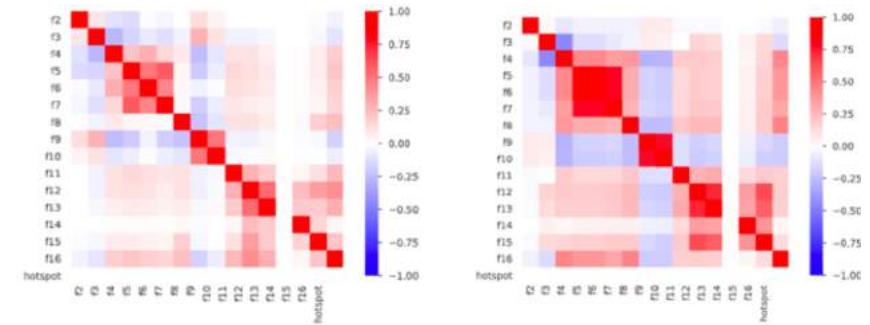

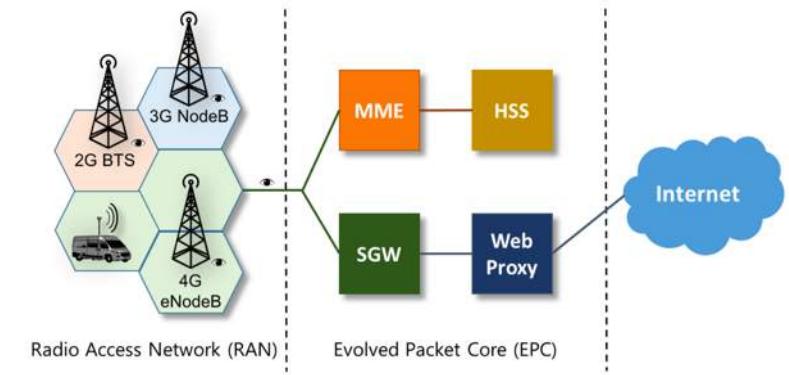

- While operators have a good understanding of the current performance of a network, forecasting the performance of each sector over time is a **non-trivial task**
- The network performance is affected by both **regular** and **non-regular events**, triggered by **human behaviour and hardware failures**

# Current Limitations

- A manual assessment cannot scale and it is **error-prone**
- Heuristic or rule-based models require **domain expertise** and **periodic updates** to account for changes temporal and contextual factors (e.g. COVID19 pandemic)
- Conventional forecasting techniques cannot model accurately the **dynamics** and **latent interactions** among the process variables

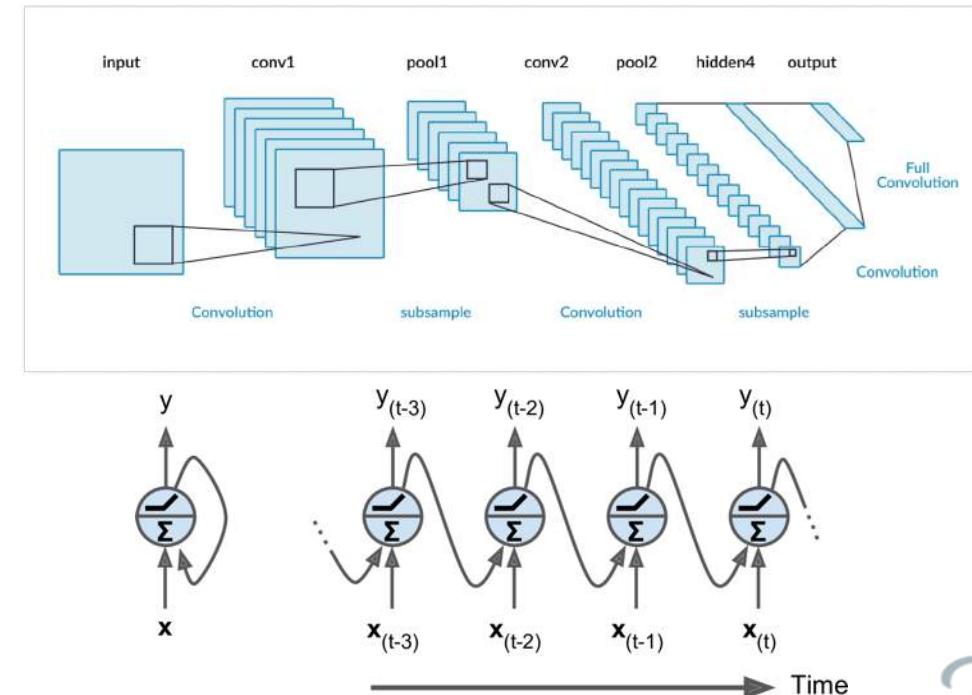

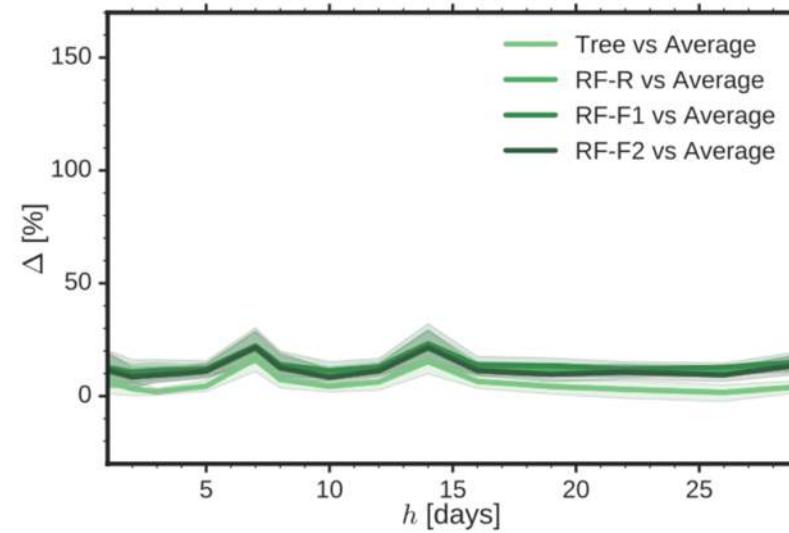

# Data

- Synthetic dataset of 999,257 observations with 16 features and ground truth:
  - More than 40K cell sites
  - 24 hours cycle
  - Dataset was unbalanced – 0.0119% of the positive class, mimicking the real data attributes

# Predictive Modeling

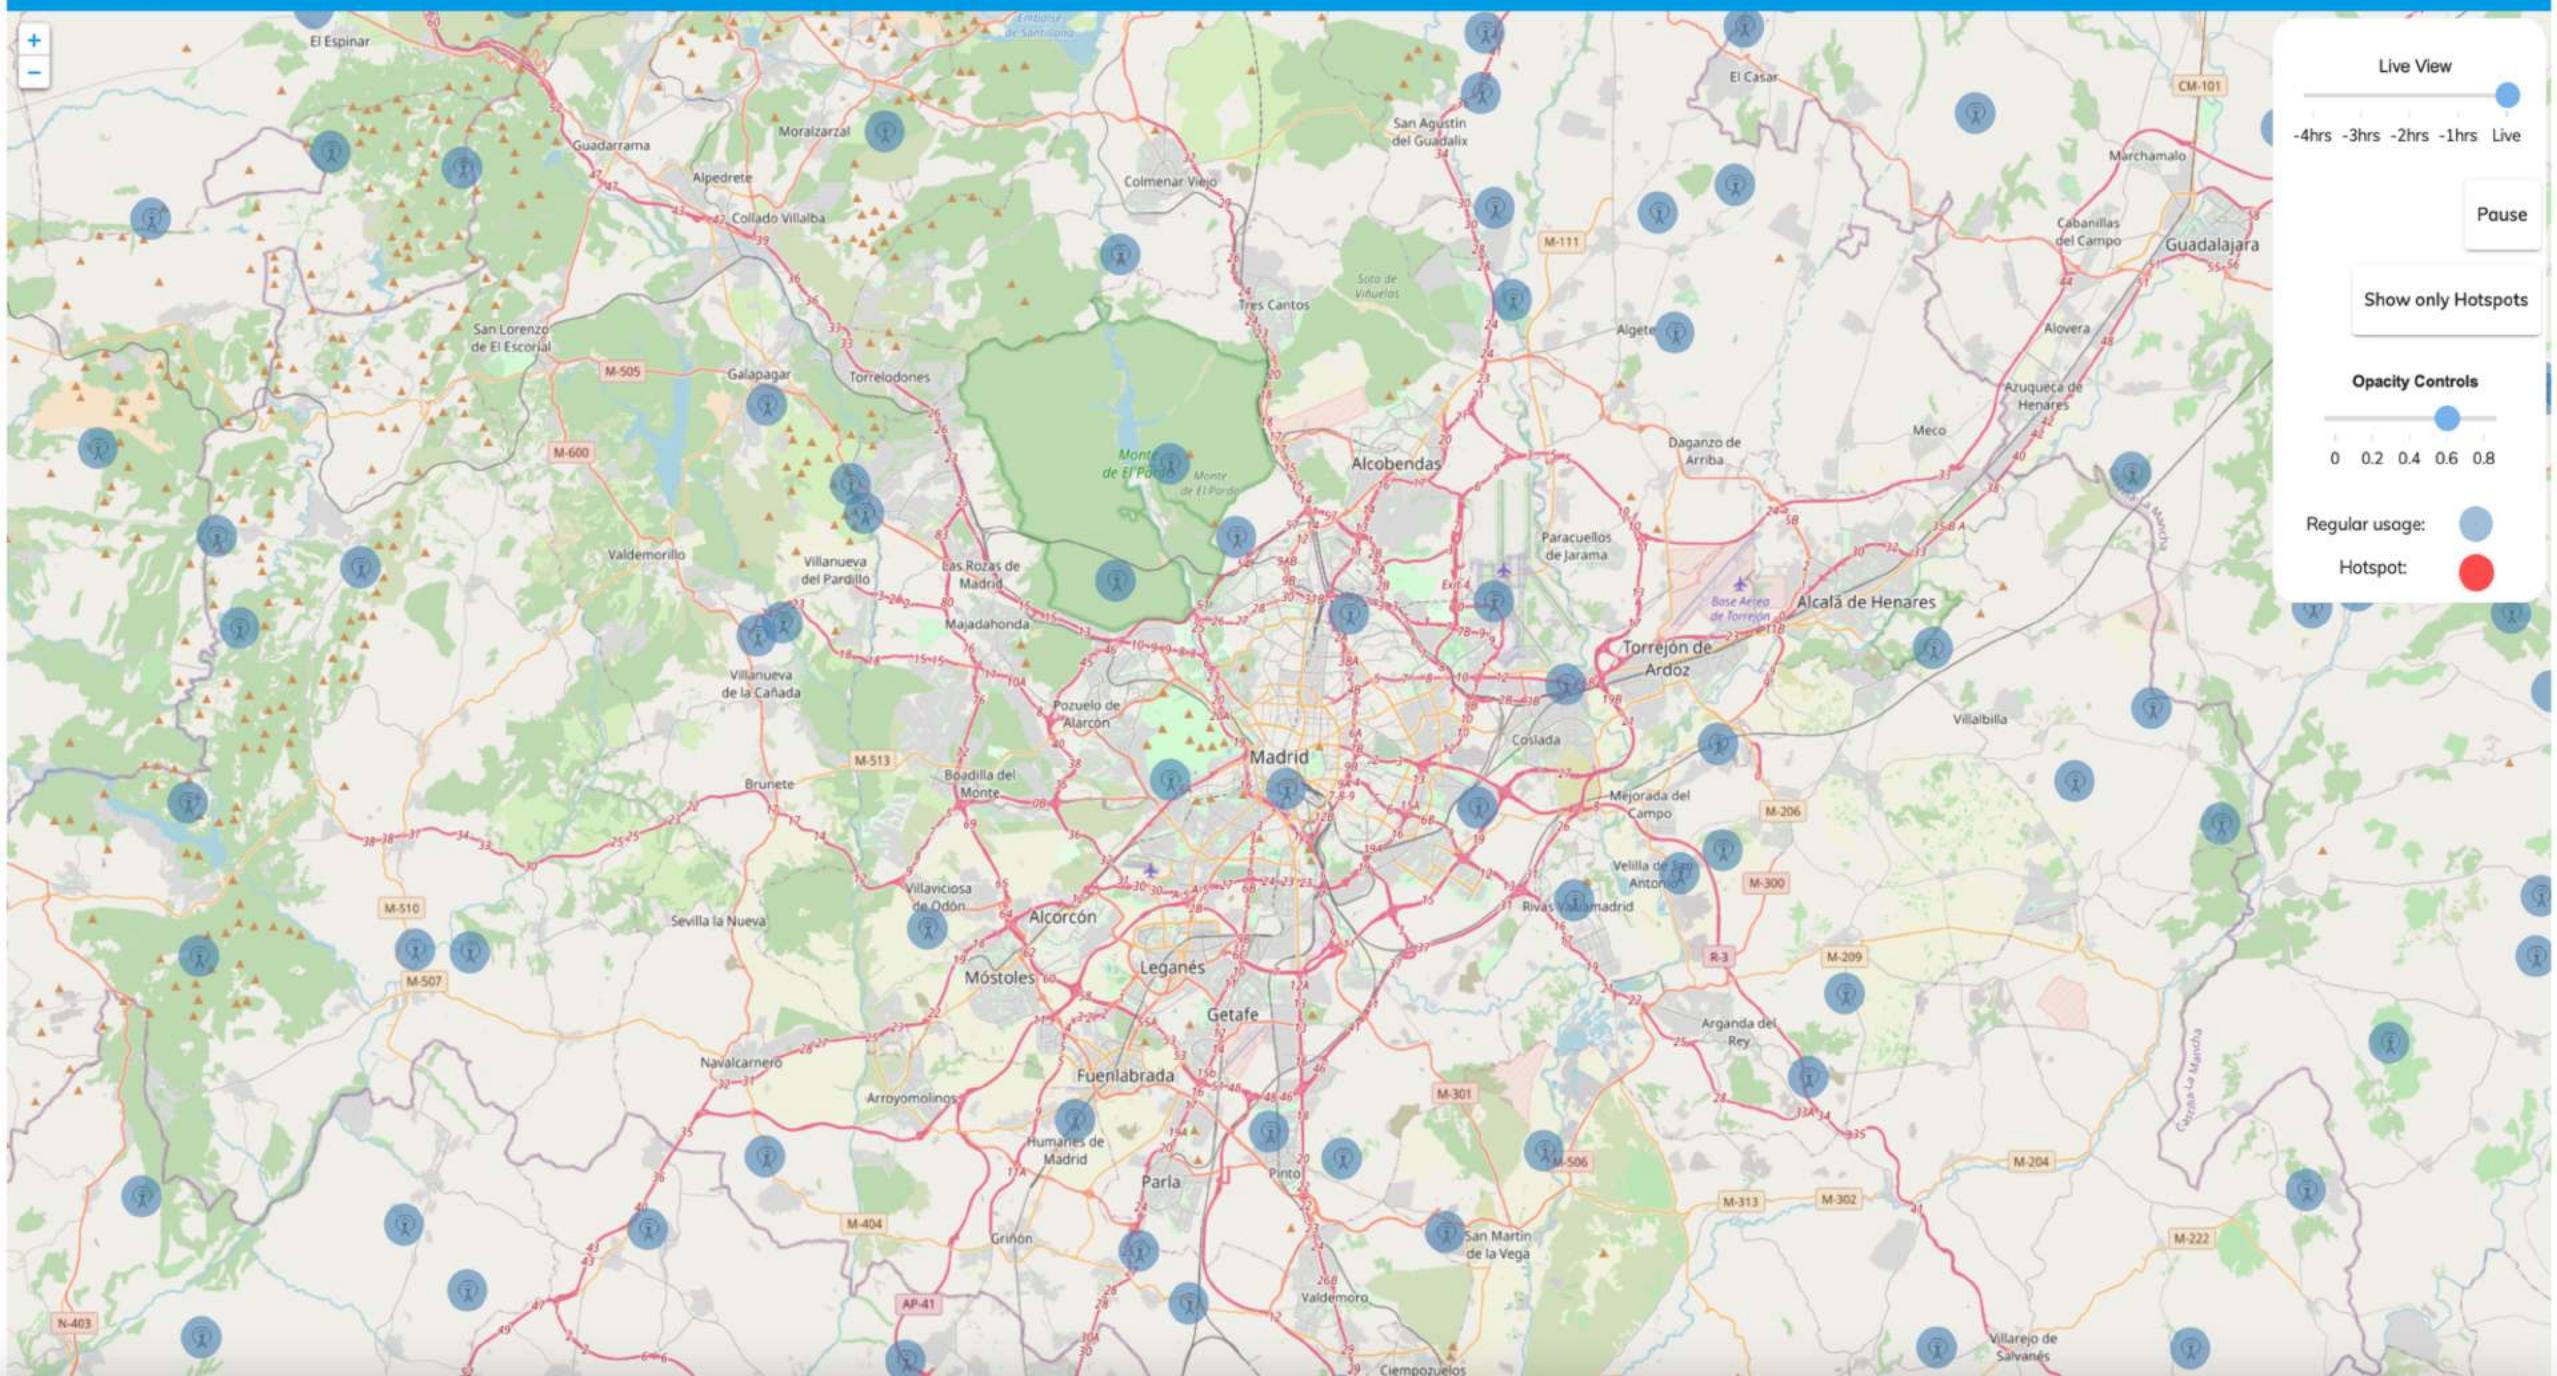

- We address this problem as a binary classification task; hence, our target variable is a binary label that corresponds to the notion of being a “hot spot” at a certain day

# KPIs

- Tested Random Forest (RF), XGBoost (XGB) and CATBoost (CB)
- Used a 80/20 train-test split
- Predict if an antenna will become hotspot in the next hr

| Model | Accuracy | Precision | Recall |
|-------|----------|-----------|--------|
| XGB   | 0.999    | 0.998     | 0.998  |
| CB    | 0.999    | 0.977     | 0.961  |
| RF    | 0.999    | 0.998     | 0.975  |

#WeAreWayra

# Telefonica Research Hackathon

- Online event on the “Quality of Service in Call Centers” between the dates 23rd to 25th of October 2020
- Students, scientists and employees from startups and SMEs from all over Europe, teamed up to address the challenge
- 8 teams, 8 mentors, 8 cutting-edge AWS servers
- Broke the **inter-** and **intra-sectorial** data-silos
- Involved different **business units** and **external companies**
- **Raised awareness** about the research output produced by the I-BiDaaS project and Telefonica Research

# Pilot 3: I-BiDaaS application to the Manufacturing Sector

Giuseppe Danilo Spennacchio  
Flexible and Adaptive Systems Specialist  
at Factory Innovation Department

CRF

December, 21<sup>st</sup> 2020

# CRF's Participation in I-BiDaaS

Manufacturing production processes are complex in that production lines have several **robots and digital tools**

**massive amounts of raw data** are gathered; data that do not only help to monitor processes, but can also improve process robustness and efficiency

Within the I-BiDaaS project, we identified two scenarios, in which **complex and initial structured/unstructured data sets** are retrieved from real processes, and defined two use cases:

- 1. Production process of Aluminium die-casting**
- 2. Maintenance and Monitoring of production assets**

The project focuses on providing a self-service solution that will give us the insights and tools we need to develop a methodology to implement in production sites :

- improve the quality of the processes and products** in a much more agile way, reducing costs due to reworks and scraps
- predict faults and unnecessary actions** (preventive or planned maintenance)

# Requirements

- Data are strictly **confidential**
- Computerized production lines store large amounts of complex structured/unstructured data

- **Lack of time** to extract and analyse data due to fast rhythms of production
- **Fast internal changes** due to rescheduling production quantities and component variations
- **Slowdown of data sharing** due to security procedures

## Requirements:

- **Data privacy:** anonymise data that can not be accessed or shared with external
- **Data cleaning:** identify incomplete, inaccurate and irrelevant parts of the data – dataset generation
- **Data analysis and advanced visualisation tools:** empower data providers decisions

## Objective:

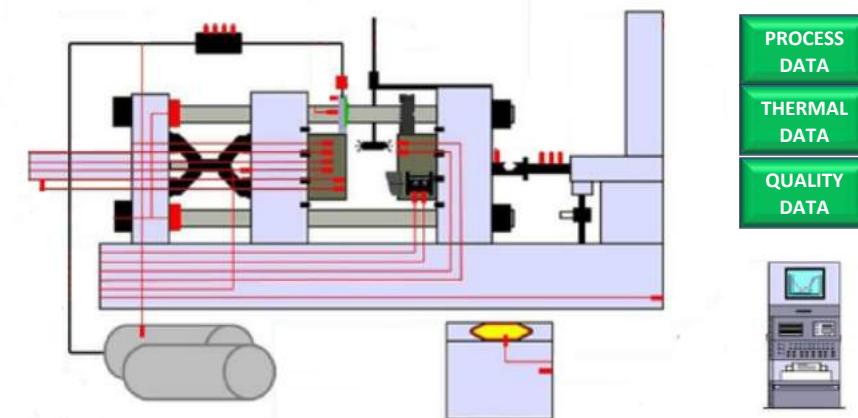

- **Quality Improvement and PM:** Exploit the I-BiDaaS platform to easily utilise Big Data analytics and develop a methodology for quality and process improvement and for Predictive Maintenance

# Production Process of Aluminium die-casting

Die-casting process:

- heterogeneous data such as piston speed in the first and second phase, piston stroke, intensification pressures, temperatures, cooling capacity, etc
- operator's data: qualitative evaluation of the process, events, etc.(e.g.: defect manually detect)

## Business Goal

### Quality Process Improvement:

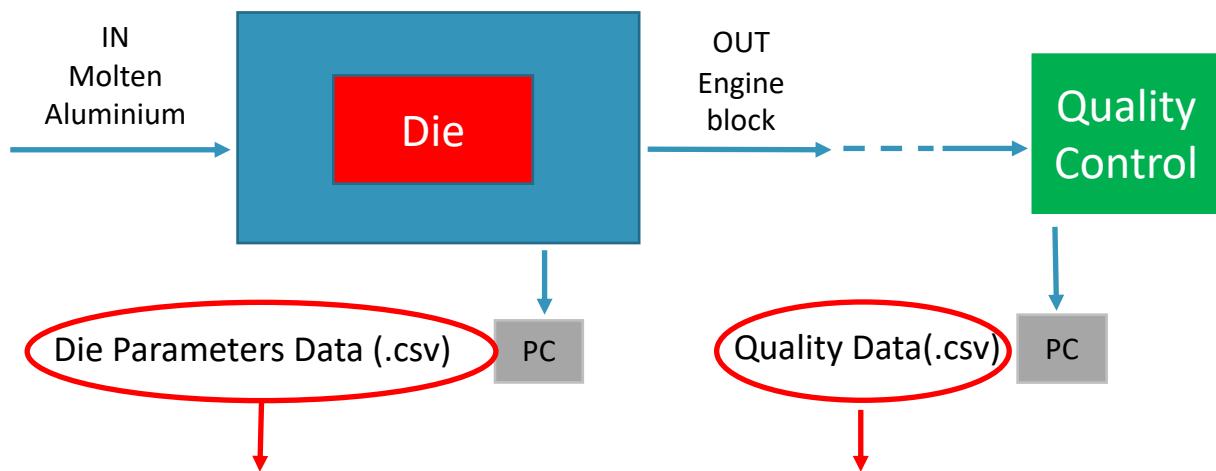

- reduce scrap and waste
- prevent repairs and further processing, by avoiding unnecessary actions after casting: impregnation, cooling, storing and management of failed engines

### Use Case Goals

- develop high level algorithms
- identify critical parameters
- provide a mode to timely check the status of the process and classify the quality levels that we are using as KPIs

# Production Process of Aluminium die-casting

- The initial data set contained: production, process and control parameters of the production of the engine block by die-casting
- Initially, CRF provided 2 datasets: 'Synthetic' and 'Anonymised'

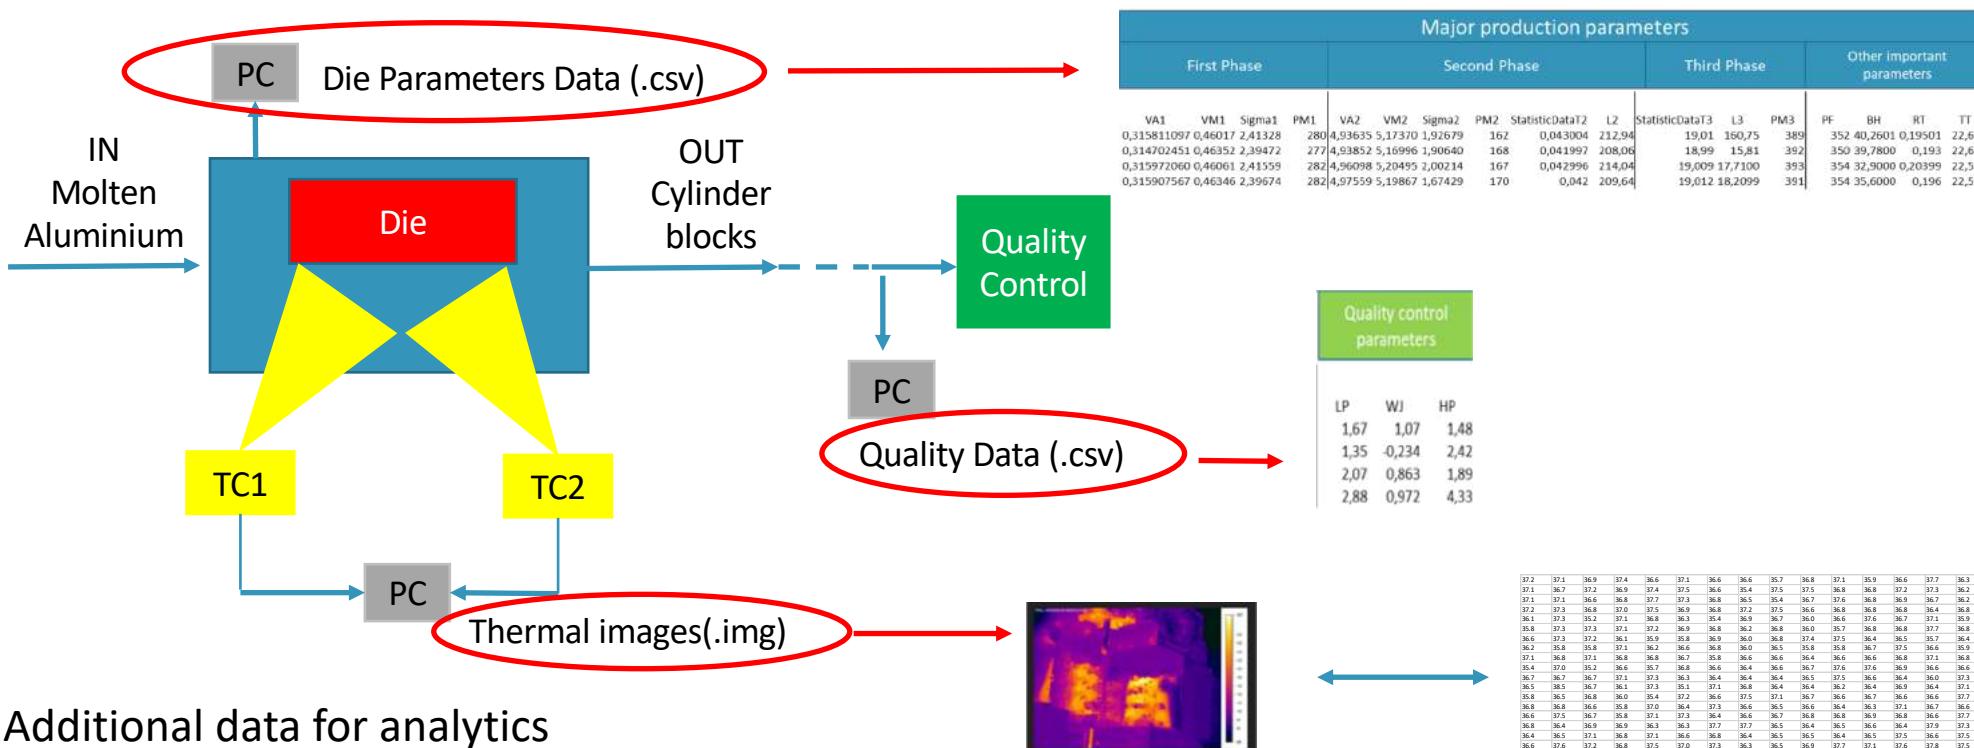

## Breaking data silos

- data sharing between company owning the data, company performing the analysis (CRF) and consortium partners
- integrate data from different sources/ levels
- involve external/ internal departments

# Production Process of Aluminium die-casting

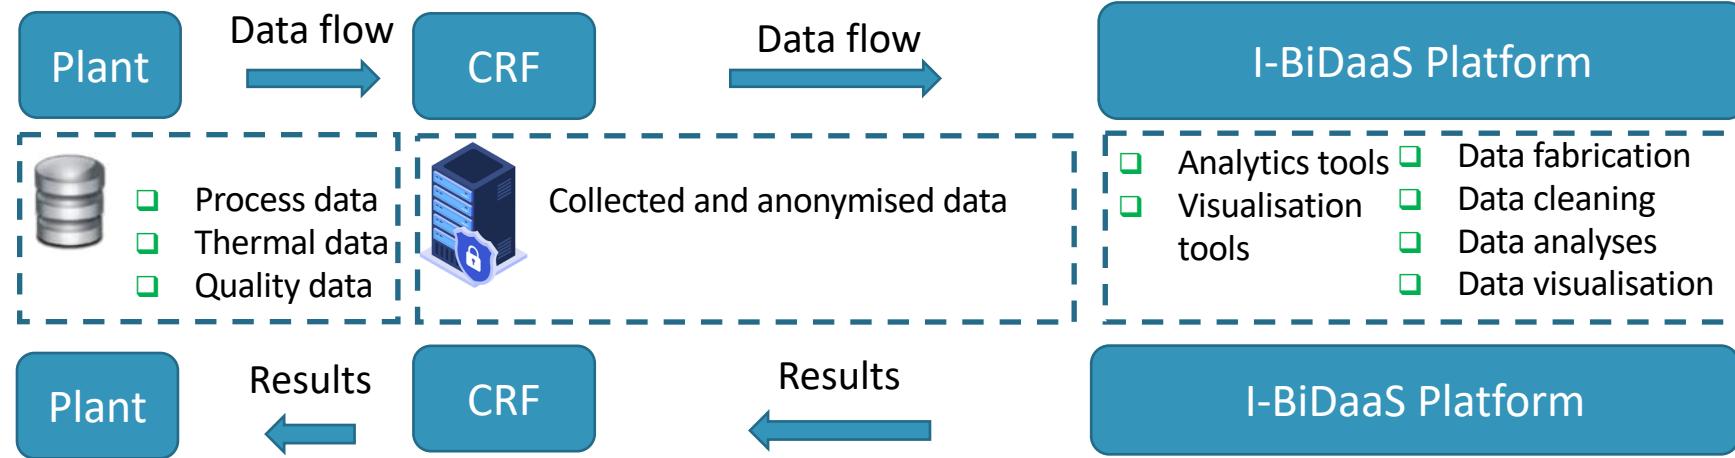

## Additional data for analytics

- thermal imaging cameras installed
  - every engine is assessed
  - each frame is discretised
  - an output file (CSV) is generated
- Temperatures values (estimated 400MB per day) to share for further analysis

# Production Process of Aluminium die-casting

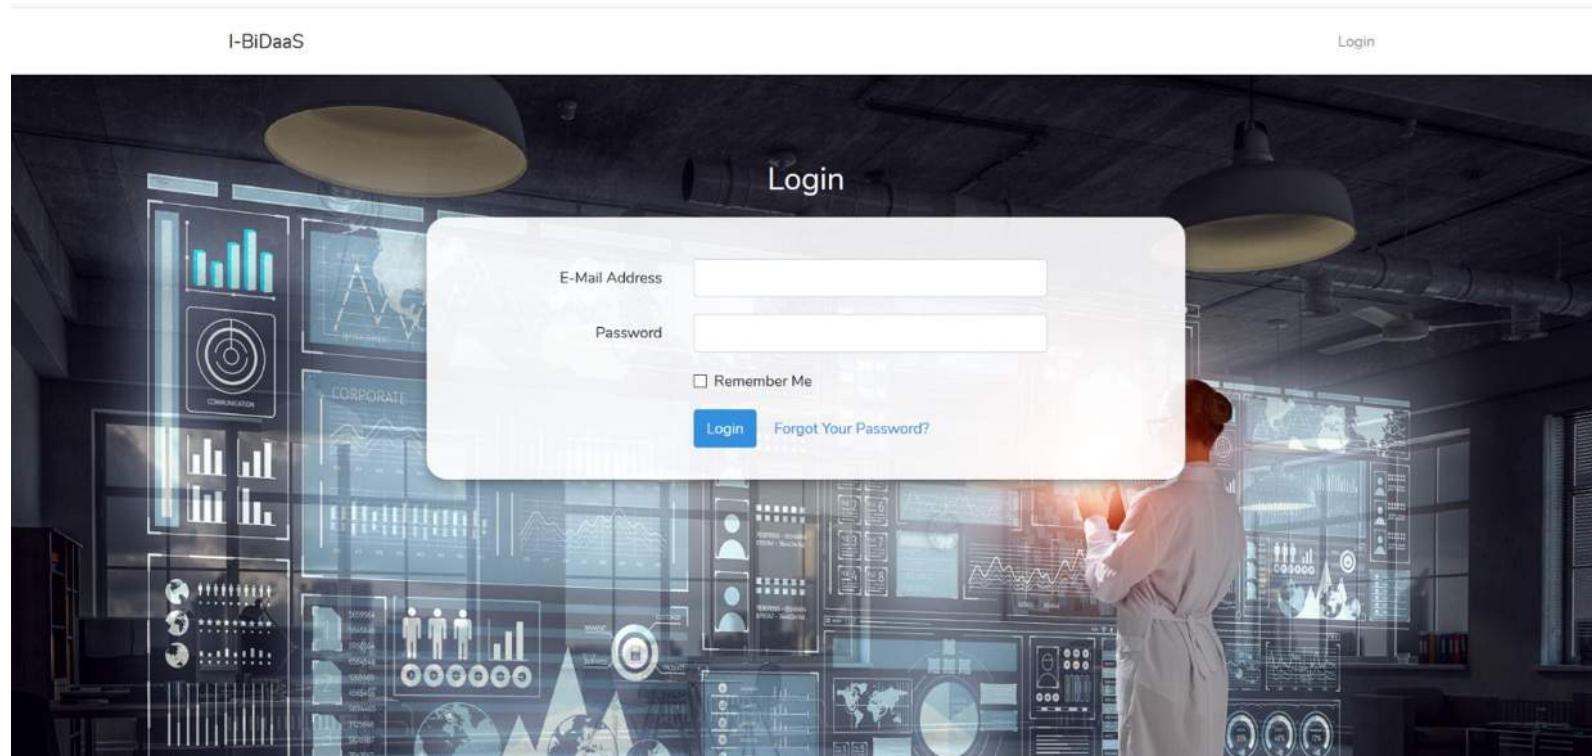

- corporate constraints do not allow to give access to CRF internal server
- data were sent to the Virtual Machine that host I-BiDaaS Platform

# Production Process of Aluminium die-casting

I-BiDaaS platform to easily utilise I-BiDaaS solutions developed by data analysts and technologists

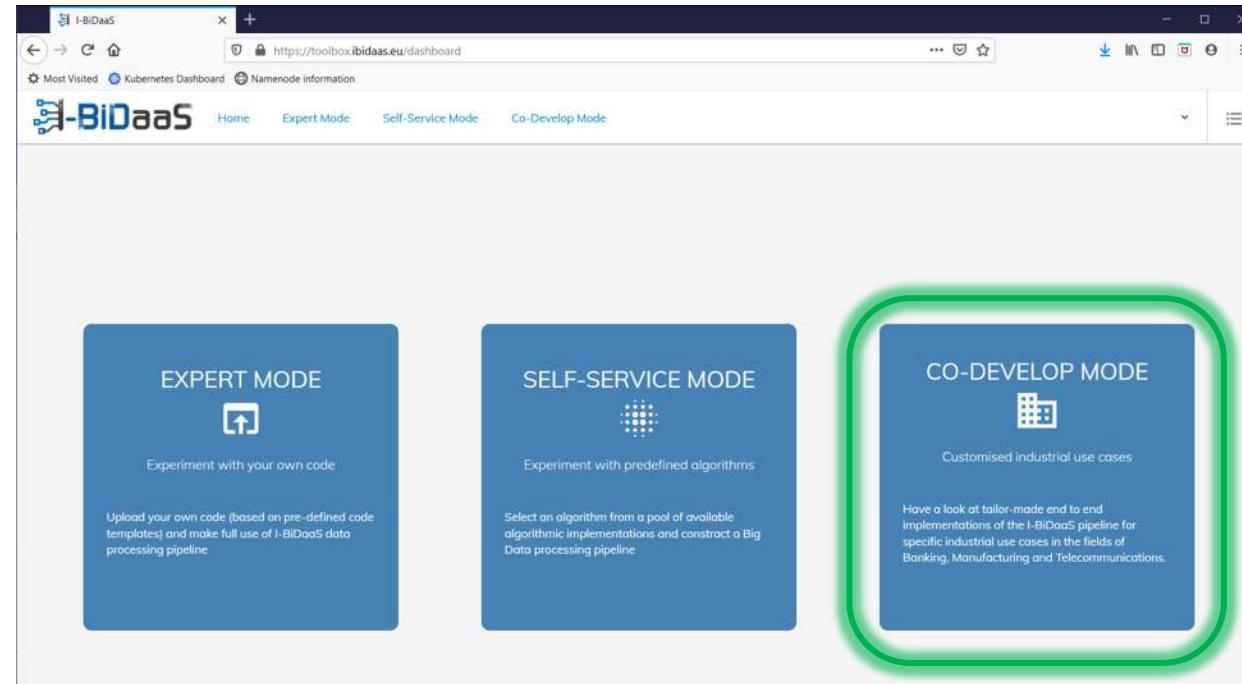

# Production Process of Aluminium die-casting

After login, we select the co-develop mode:

- end-to-end solution developed by the I-BiDaaS team for this use case
- dataset formats and analysis setup are predefined and custom-made according to our needs
- examples of how the I-BiDaaS platform and tools can be applied to real-world applications based on real business needs

# Production Process of Aluminium die-casting

The production process of Aluminium die-casting is a complex industrial process with many heterogeneous parameters. The co-develop mode allows us to quickly check the quality level classification

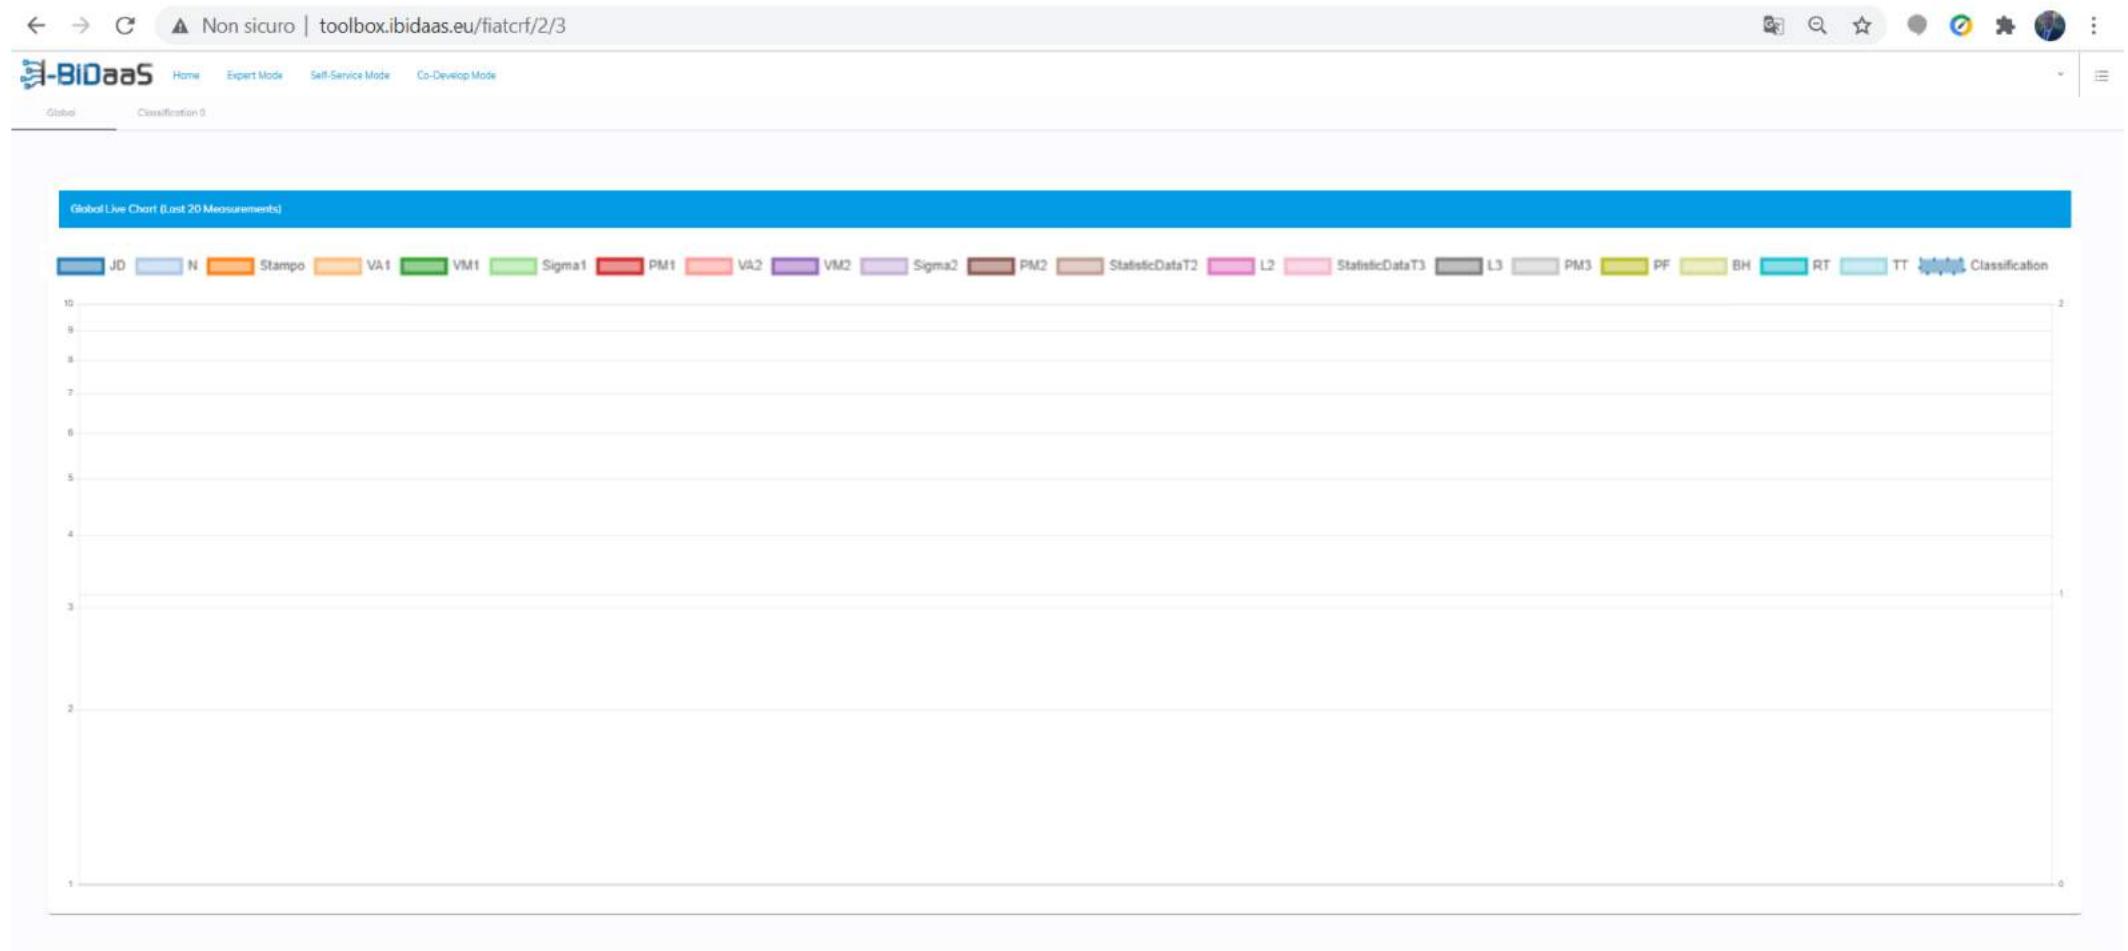

**I-BiDaaS Use Cases**

- CAIXA: Analysis of relationships through IP addresses (Batch processing)**  
The CAIXA IP Addresses Use Case is about extracting relations between IP addresses. In this use case batch processing of big data emerges as an innovative tool that can be instrumental in fraud detection.  
  
Status: open Upd: 2018-12-12 10:33:38
- CAIXA: Analysis of relationships through IP addresses (Stream processing)**  
The CAIXA IP Addresses Use Case in streaming mode allows for real-time IP relationship detection on incoming data and also the graph representation of relationships among the IPs.  
  
Status: open Upd: 2018-12-12 12:37:52
- CRF: Production process of aluminium die-casting (Stream processing)**  
The use case deals with monitoring the quality of the production process of aluminium casting. The goal is to use Big Data for improving the quality of the production process and operational efficiency, in particular, the quality issues on the automotive component.  
  
Status: open Upd: 2019-02-26 09:23:03
- TID: Quality of Service in Call Centres (Stream Processing)**  
The use case is about monitoring the sentiment of callers to Telefonica's call centres. Using GPU accelerated processing and real-time visualisations of sentiment and frequent words in calls, better analysis and increased performance are envisaged.  
  
Status: open Upd: 2019-02-26 09:23:03

# Production Process of Aluminium die-casting

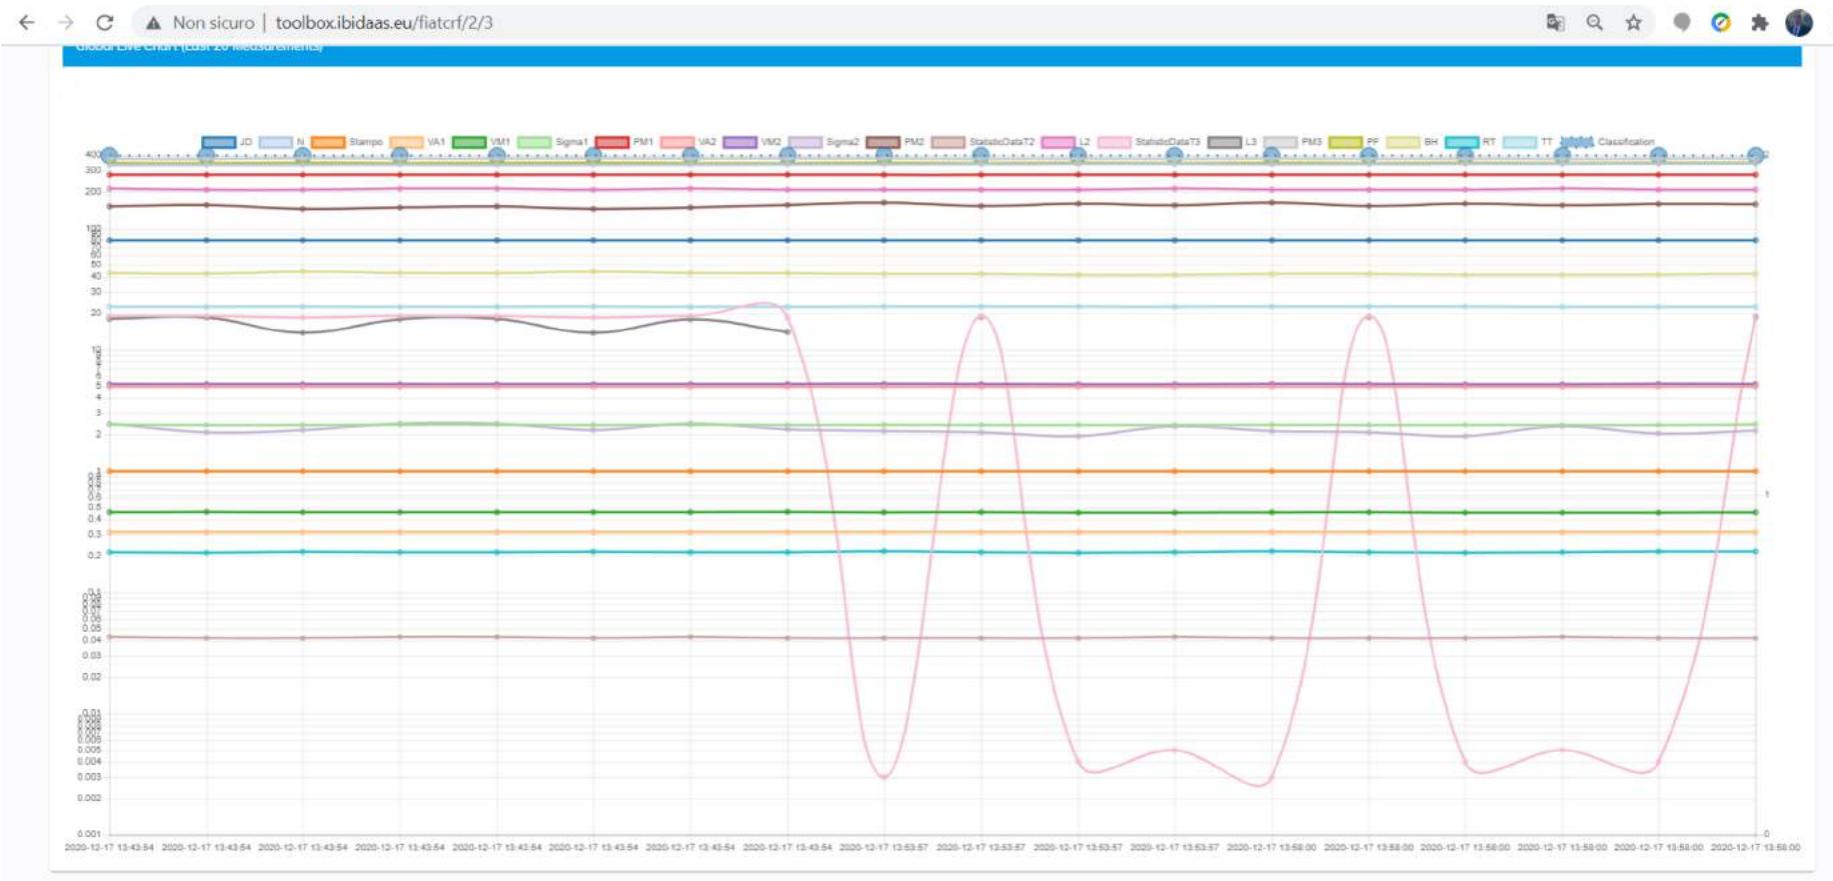

A Global live chart shows the main parameters of the incoming streaming data in real-time

# Production Process of Aluminium die-casting

We can visualise the trend of parameters and quickly check if there is something of anomalous compared to the set values of parameters

# Production Process of Aluminium die-casting

We can visualise the data table, that shows a colour- coded presentation of the results according to a given dimension of data (classification level)

The screenshot displays a web-based interface for monitoring the 'Live Production Process of Aluminium die-casting'. At the top, there is a navigation bar with icons for back, forward, search, and other browser functions. Below the navigation bar is a blue header bar with the title 'Live Production Process of Aluminium die-casting'.

The main content area consists of three main sections:

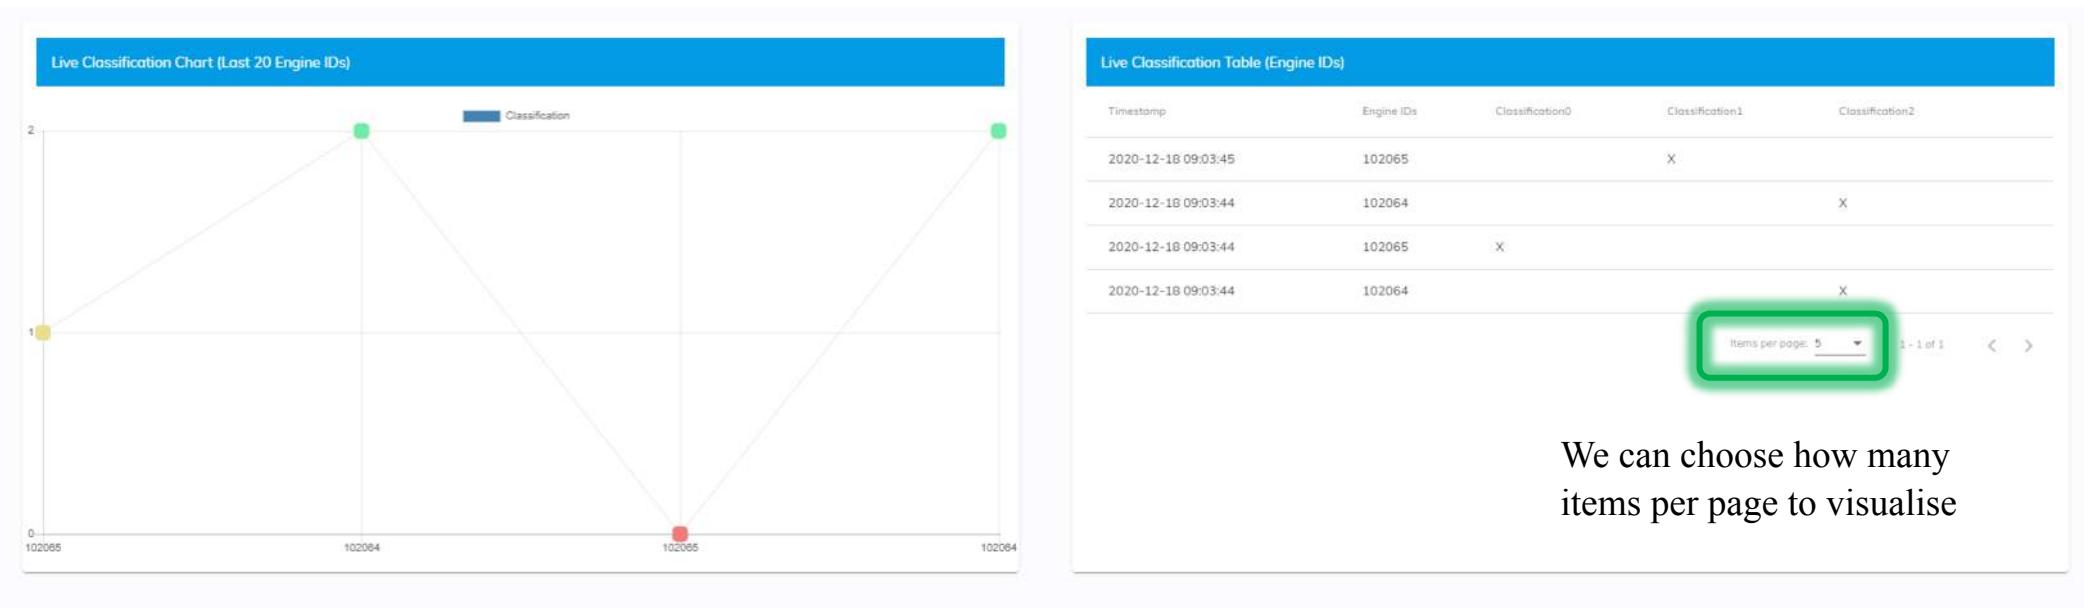

- Data Table:** A table showing production data for four different entries. The columns include Timestamp, Classification, JD, N, Stampo, VA1, VM1, Signal1, PM1, VA2, VM2, Signal2, PM2, StatisticDataT2, L2, StatisticDataT3, L3, PM3, PF, BH, RT, and TT. The rows are color-coded: the first row is yellow, the second is green, the third is red, and the fourth is light green. A green box highlights the 'Items per page' dropdown menu at the bottom right of the table.
- Classification % (Global):** A pie chart showing the distribution of classification levels. It has three segments: 'Zero' (red), 'One' (yellow), and 'Two' (green). The 'Zero' segment is 20%, 'One' is 25%, and 'Two' is 55%. A green box highlights the legend below the chart.
- Parameters Measurements Statistics:** A table showing statistical measurements for various parameters. The columns are type, min, max, and avg. The rows include JD, N, Stampo, VA1, and VM1. A green box highlights the 'Items per page' dropdown menu at the bottom right of this section.

We can choose how many items per page to visualise

# Production Process of Aluminium die-casting

We can visualise in real time and quickly the sequence of engine block with their level of classification

# Maintenance and Monitoring of production assets

Welding cell data come from:

- sensors mounted on different machines:
  - accelerometers mounted on linear stages, robots, elevators
  - electric consumption, flows, temperature and energy vectors
- production data: model, variant, mix

## Business Goal

### Predictive Maintenance:

- predict faults before they happen
- predict unnecessary actions (preventive or planned maintenance)
- avoid micro or macro stoppages
- predict retooling and refurbishing

## Use Case Goals

- collect, structure and analyse sensor data with high level algorithms
- obtain thresholds for anomalous measurements
- create a structured foundational database to be easily utilised to check outlier detections for a continuous and periodic control of the service conditions (PM)

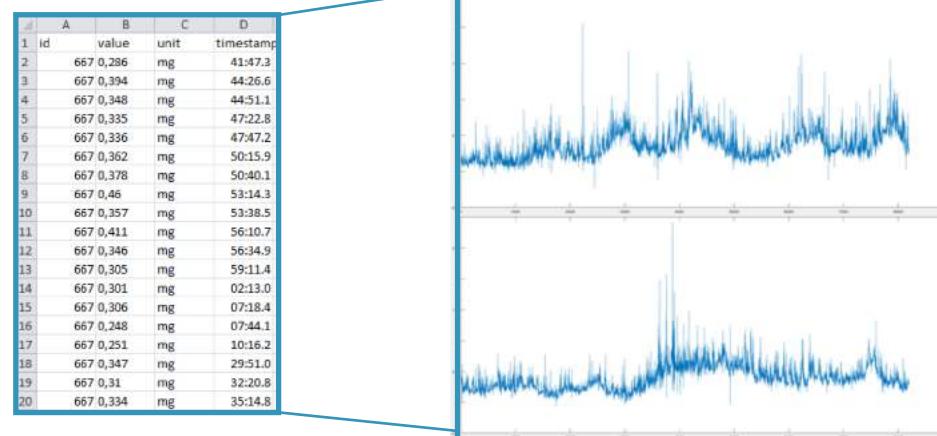

# Maintenance and Monitoring of production assets

The data set contains: production, process and control parameters of the production of the Daily vehicle.

CRF provided 2 data sets: “**Anonymized SCADA**”,  
“**Anonymized MES**”,

- data related to the car body model processed
- to allow to detect different vibrations due to the different car body model that is passing on the production line

- accelerometers: used for measuring vibration and shock on machines and basically anything that moves
- the monitoring of vibrations is important to check the status of a machine
- the analysis of the trend of vibrations over time allows to predict the onset of deterioration and to intervene in time before the failure

# Maintenance and Monitoring of production assets

- MES data showed high variance in measurements even for the same vehicle type
- problems to retrieve MES data because of rescheduling activities and changes in the production lines, partially due to the Covid-19 situation
- relevant information are in SCADA data, used to obtain thresholds for anomalous measurements for all sensors

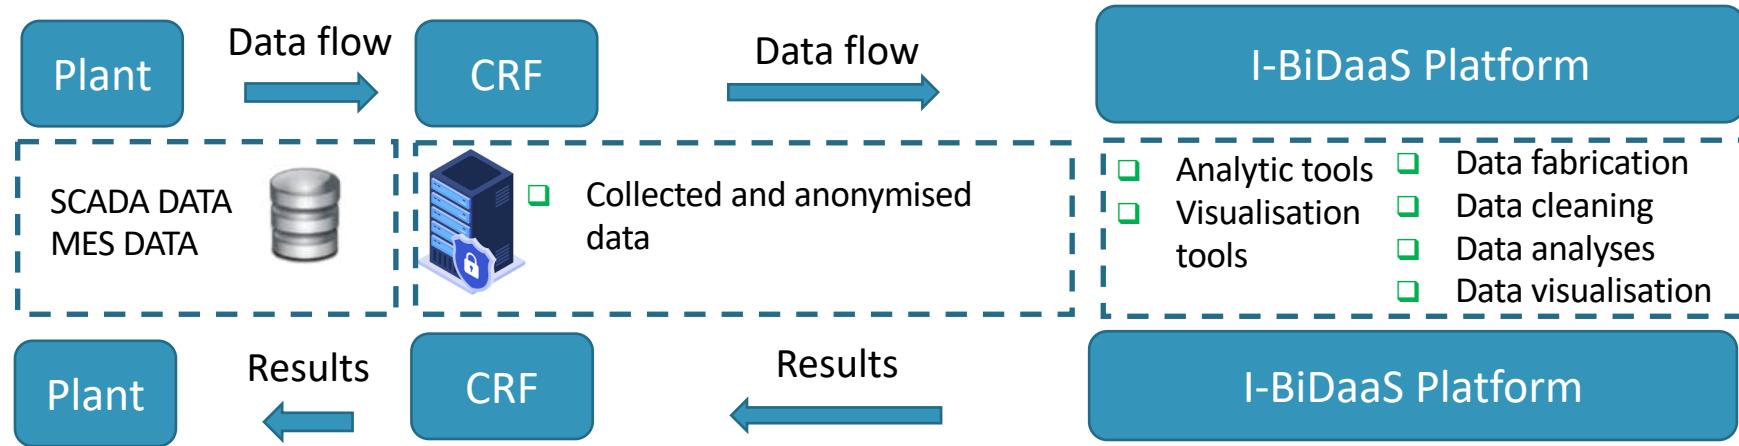

| Number of sensors | Physical Quantity Measured | Unit of measurement |
|-------------------|----------------------------|---------------------|
| 87                | Acceleration               | mg                  |
| 30                | Velocity                   | mm/s                |
| 9                 | Temperature                | °C                  |
| 8                 | Pressure                   | bar                 |
| 8                 | Flow                       | l/min               |
| 1                 | Displacement               | mm                  |
| 2                 | Energy Vector(water)       | l                   |
| 1                 | Energy Vector(air)         | m³                  |
| 1                 | Energy Vector(air)         | m³/h                |

Id identifies  
the sensor

| id  | value    | unit | timestamp       |
|-----|----------|------|-----------------|
| 109 | 122,149  | mg   | 31/1/20 5:07:49 |

# Maintenance and Monitoring of production assets

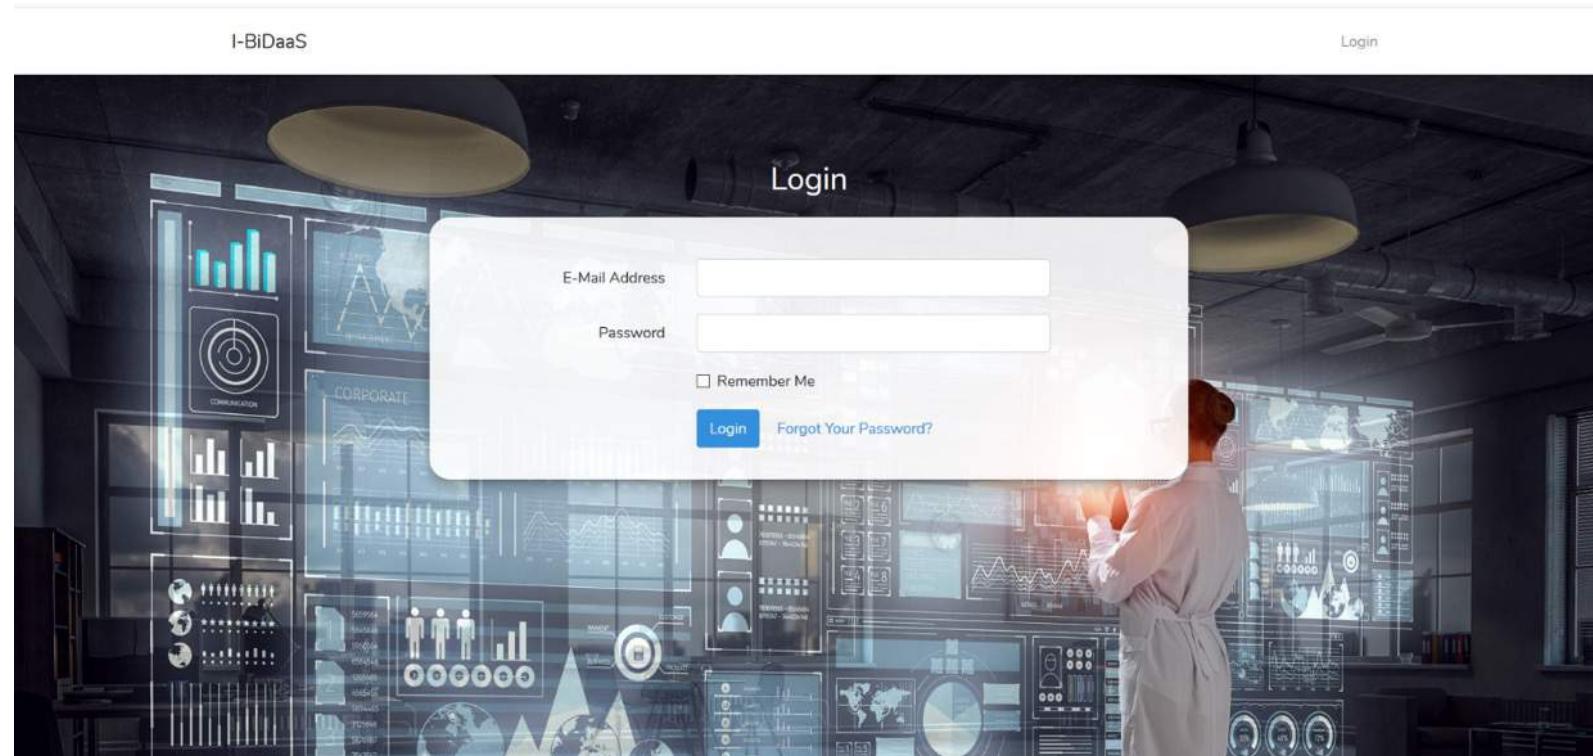

- corporate constraints do not allow to give access to internal servers
- data were sent to the Virtual Machine that host I-BiDaaS Platform

# Maintenance and Monitoring of production assets

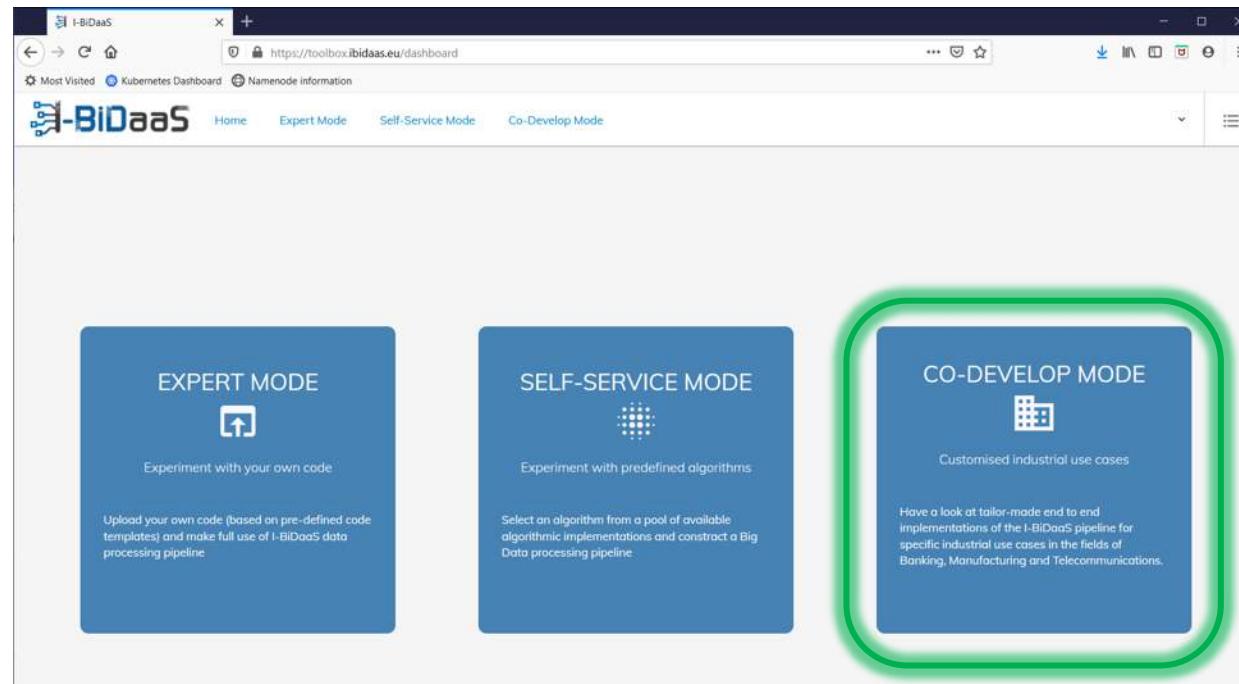

I-BiDaaS platform to easily utilise I-BiDaaS solutions developed by data analysts and technologists

# Maintenance and Monitoring of production assets

After login, we selects co-develop mode, in which the data source and analysis algorithm are predefined

# Maintenance and Monitoring of production assets

Maintenance and Monitoring of production assets. The co-develop mode allows us to monitor the outlier time series for each sensor any day

The screenshot shows a web-based interface for i-BiDaas Use Cases. The top navigation bar includes the i-BiDaas logo, Home, Expert Mode, Self-Service Mode, and Co-Develop Mode. The main content area displays four use cases:

- TID: Optimization of placement of telecommunication equipment (Batch Processing)**: Shows a map of antenna locations with red and blue dots. Description: This case concerns the monitoring of the load percentages of Telefonica's antennas over a period of time in order to observe and therefore to predict possible congestions caused by the users' movement around an area.
- TID: Accurate location prediction with high traffic and visibility (Stream Processing)**: Shows a map of a city with many small colored dots. Description: This use case demonstrates high accuracy predictions of Telefonica's antennas that will become the next 'hotspots', i.e. will have increased load.
- CRF: Maintenance and monitoring of production assets (Batch Processing)**: This card is highlighted with a green rounded rectangle. It shows two charts: a histogram and a line graph with vertical spikes. Description: In this use case, sensor data have been analysed in order to identify anomalies in the measured values. Monitoring these anomalies can help operators perform predictive maintenance tasks and avoid sensor breakdowns.
- CAIXA: Enhance control of customers to online banking access (Stream Processing)**: Shows a dashboard with a bar chart, a pie chart, and a line graph. Description: Demo Version.

Status: open Upd: 2019-02-26 09:23:03      Status: open Upd: 2019-02-26 09:23:03      Status: open Upd: 2019-02-26 09:23:03      Status: open Upd: 2019-02-26 09:23:03

# Maintenance and Monitoring of production assets

Structured foundational database to be easily utilised to check outliers for a continuous and periodic control of the service conditions (Predictive Maintenance).

The screenshot shows a web browser window for the i-BiDaaS platform. The URL in the address bar is `toolbox.ibidaas.eu/fiatcrf/maintenance`. The page title is "Maintenance and Monitoring of production assets". The top navigation bar includes the i-BiDaaS logo and links for "Home", "Expert Mode", "Self-Service Mode", and "Co-Develop Mode". Below the title, a blue header bar contains the text "Monitoring of production assets - CRF/FCA". A sub-instruction "Choose a month to proceed with the analysis" is displayed. A date picker for the year 2020 is shown, with May selected. Other months (Jan, Feb, Mar, Apr, Jun, Jul, Aug, Sep, Oct, Nov, Dec) are also visible.

# Maintenance and Monitoring of production assets

## Sensors - Categories

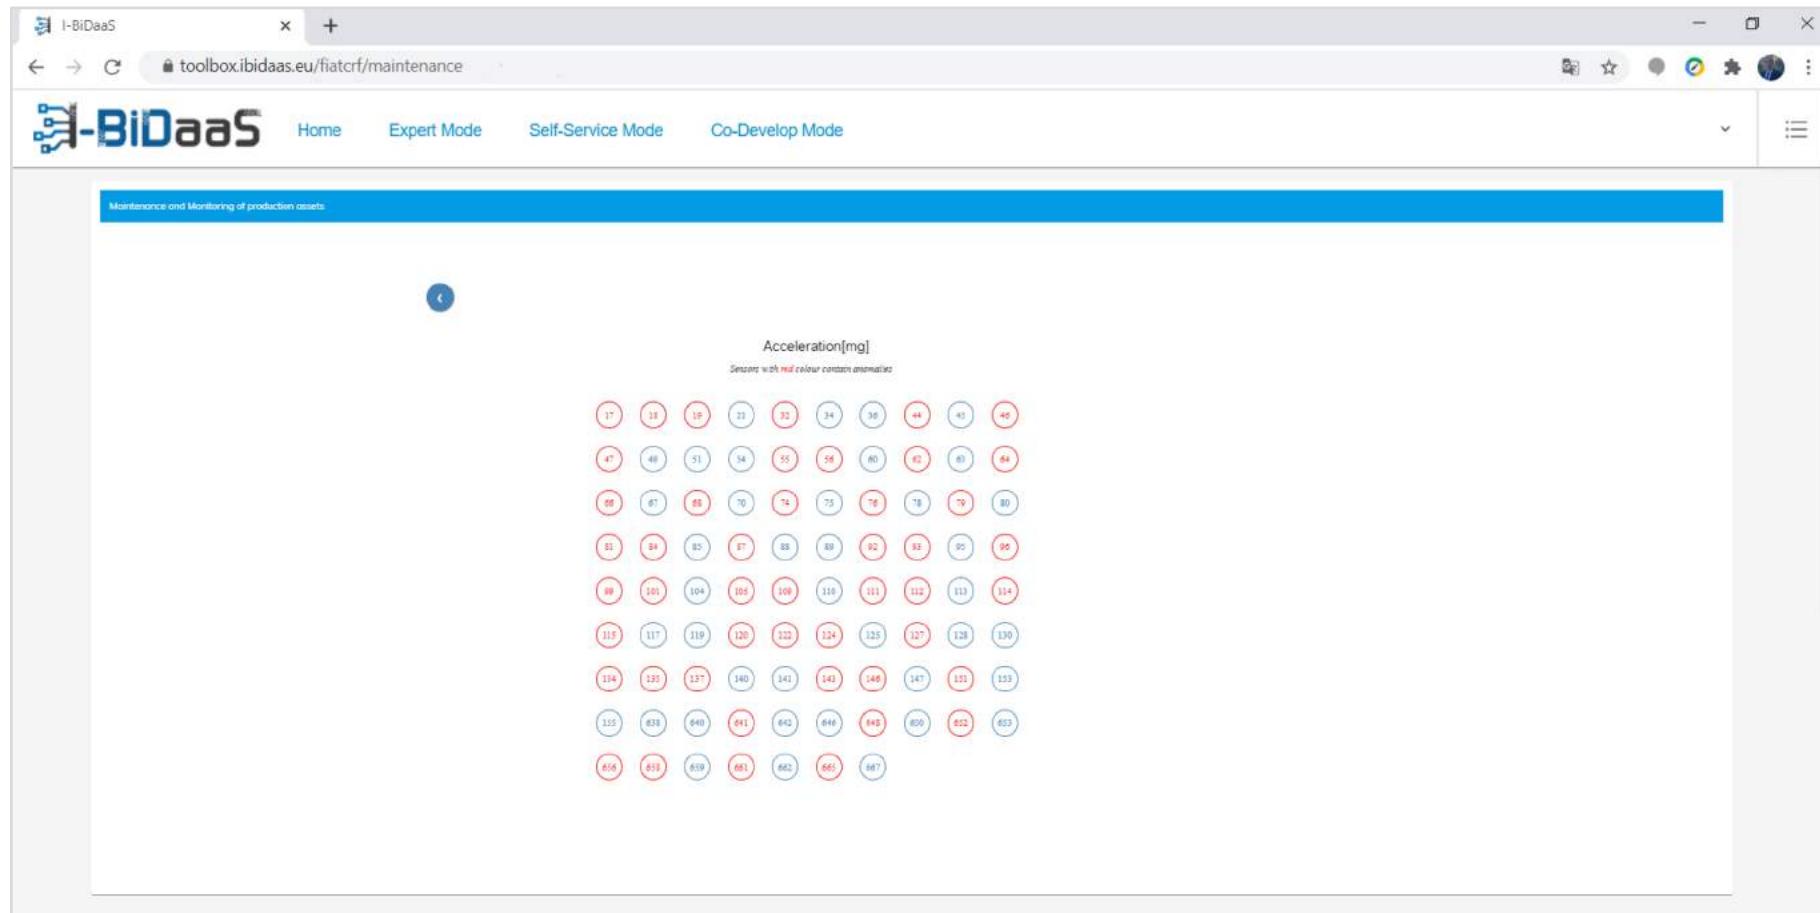

The screenshot shows a web browser window for the i-BiDaaS platform. The URL in the address bar is [toolbox.ibidaas.eu/fiatcrf/maintenance](http://toolbox.ibidaas.eu/fiatcrf/maintenance). The top navigation bar includes the i-BiDaaS logo, Home, Expert Mode, Self-Service Mode, Co-Develop Mode, and a dropdown menu. A blue header bar displays the text "Maintenance and Monitoring of production assets". Below this, a section titled "Sensors Categories" contains nine rounded rectangular buttons, each representing a sensor type with its unit:

- A [mg]
- V [mm/s]
- T [°C]
- P [bar]
- F [l/min]
- D [mm]
- EVW [l]
- EVA1 [ $m^3$ ]
- EVA2 [ $m^3/h$ ]

# Maintenance and Monitoring of production assets

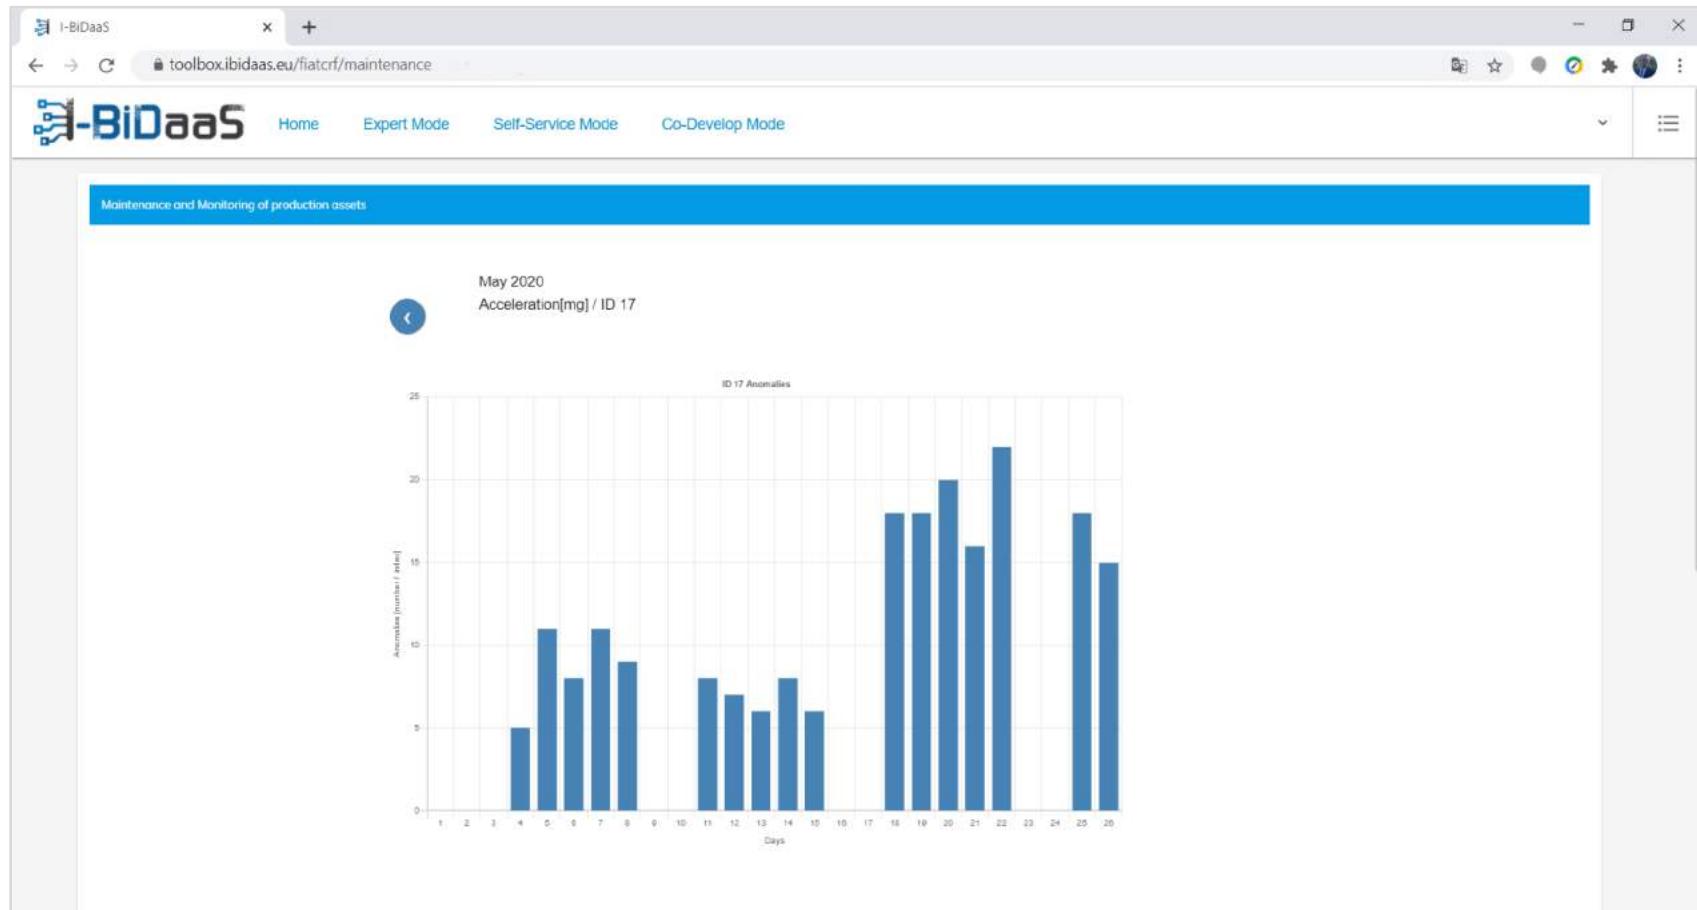

## Accelerometer [mg] / Id sensor

# Maintenance and Monitoring of production assets

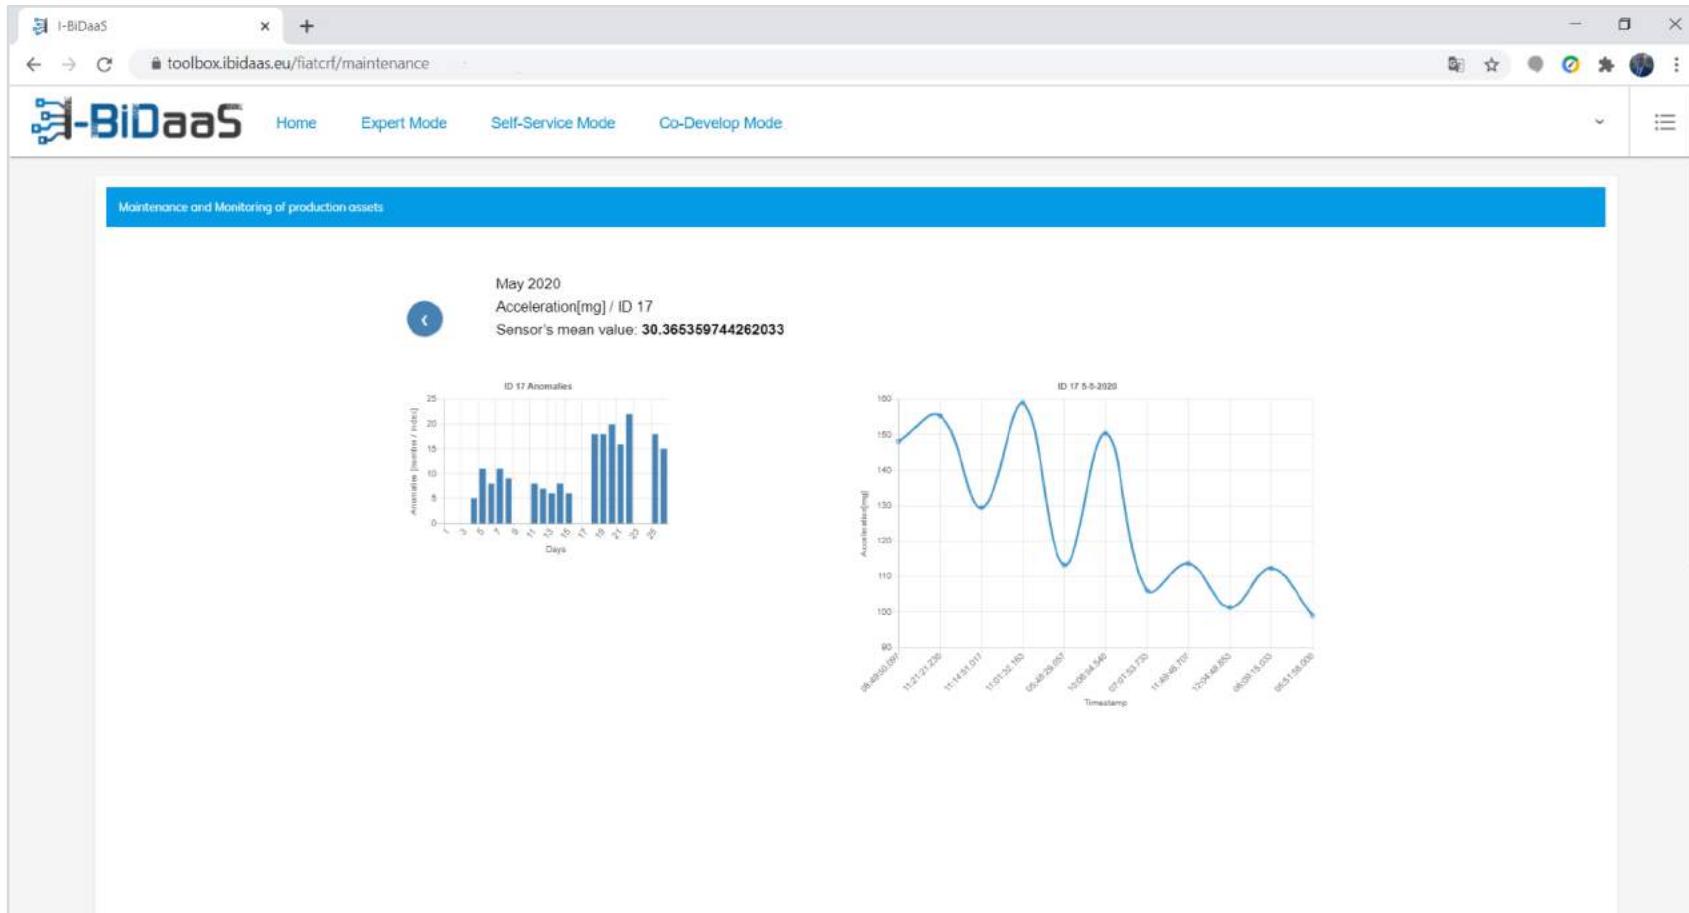

## Anomalies number per day

# Maintenance and Monitoring of production assets

- Data has been transformed into separate time series - one per sensor
- anomalous measurements

# CRF benefits from I-BiDaaS

| Benefits  | KPIs   |
|---|--|
| enhance production times, to reduce costs and, consequently, to obtain results that satisfy manufacturers' requests in terms of product quality, machine performance and timing   | Increase of 3-7 % of quality control level related to good products and decrease of 1-4% and 0.5-2 % of two quality control levels related to defective products |
| improve the efficiency of manufacturing plants, by getting the best performance from the machinery to reduce production losses and achieve greater competitiveness of the company | Increase of 1-1.5 % in current Overall Equipment Effectiveness (OEE) and decrease of 20-30 % in maintenance costs  |
| reduce time to produce decisions  | From one month to few hours, a turn of job or 1 day  |
| achieve accuracy of new models with respect to internal CRF models in use   | Increase of 6 % for the first use case and 20% for the second one  |

# Hackathon in Campus Melfi – June 2019

- students, PhDs, researchers and employees from SMEs have been involved in the CRF's Hackathon
- the data set was previously processed by the CRF which structured and anonymized the large volume of data provided by the plant
- the teams worked by using different softwares (Minitab, Excel, R) and methods: Neural Networks (Multi Layer Perceptron MLP), Decision Trees, Random Forest and Generalized Additive Model (GAM) for Big Data
- each group was able to find valuable results using also different techniques than the ones used in the analysis performed by CRF previously

# Hackathon in Campus Melfi – June 2019

- Technical results:

- ✓ **Benchmark:** With the same data set, the I-BiDaaS team achieved 80% classification accuracy, while best reported by other teams was 73-74%.
- ✓ **Validation:** Other teams found similar features as the I-BiDaaS team did, while the modelling approach was different. This cross-validates the project approach with others.
- ✓ **Casting process phases:** Other teams took into account the three phases of the casting process while the project team did not.
- ✓ **Data cleaning:** Other teams pointed to a problem in Result\_2 data, i.e., there was class label 4, while we did not take this into account.

- Other important outcomes/advances:

- Break silos: I-BidaaS got access to real anonymized data and engine casting process, the data is at least order of magnitude larger than the data previously available to the consortium.
- Data fabrication: New approaches for fabricating data \*with labels\* were brainstormed and delivered during the hackathon.

# Lessons learned - Best practices

1. **Data ingestion and data management** from different data sources and levels over time
2. Extraction of the **value of all data** collected
3. Involvement of **different departments** belonging to the same or different organizations (**breaking data silos**)
4. **Data cleaning** (to identify incomplete, inaccurate and irrelevant parts of the generated dataset)
5. **Fabrication of realistic synthetic data** for experimentation and testing
6. **Batch and stream analytics** for increasing the speed of data analysis for the specific identified business requirements
5. To bridge the **I-BiDaaS infrastructure** with the industrial internal server **for real-time data transfer and near to real-time data analysis**
6. To create an **iterative process** for the data collection design process and data analysis
7. To allow **flexibility and redundancy** to take into account unexpected or severe conditions, including subsystem failure, unavailability of data, etc.
8. **Simple, intuitive and effective visualization of results** and interaction capabilities for the end-users

# Conclusion

## Specialists and competencies:

- discover new information:
  - data are stored, but also they are unstructured and noisy
- identify patterns that enable us to improve processes and identify variables that affect production:
  - industries are not sufficiently able to extract the value (sometimes hidden) “inside” data
- improve new digital services in the industrial sector:
  - advanced manufacturing processes are increasingly complex and computerized

## As a service:

- empower expert/ non expert usage of huge quantities of data
- enable real time or near real time data transfer/ data analysis / internal procedures update
- include new competences in data analysis/ update automatically (SMEs, partners)

## Our Mission

# Unleashing the value of Big Data

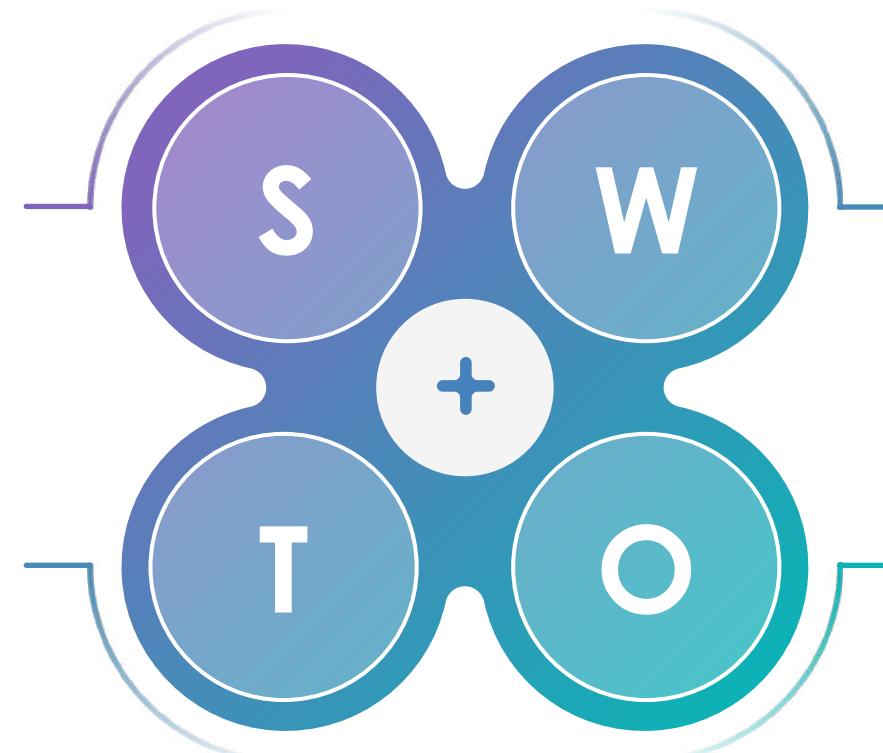

# SWOT Analysis

| <b>STRENGTH</b>   |
|---|
| Flexible and modular platform                                     |
| Empowers end users, improving the uptake of Big Data technologies |
| Unlocks data silos  |
| Use of lean business models                                       |

| <b>THREATS</b>  |
|---|
| Competitors developing platforms for big data analytics                   |
| Lack of data valuation standards in marketplaces                          |
| Legal block to the free-flow of data and uncertainty around data policies |
| Restrictions in data sharing and data availability                        |

| <b>WEAKNESS</b>                      |
|--------------------------------------|
| Areas of application                 |
| Function differently across browsers |

# Market trends are in our favor

Forecast: Big Data size revenue worldwide from 2019 – 2027 (in billion U.S. dollars)

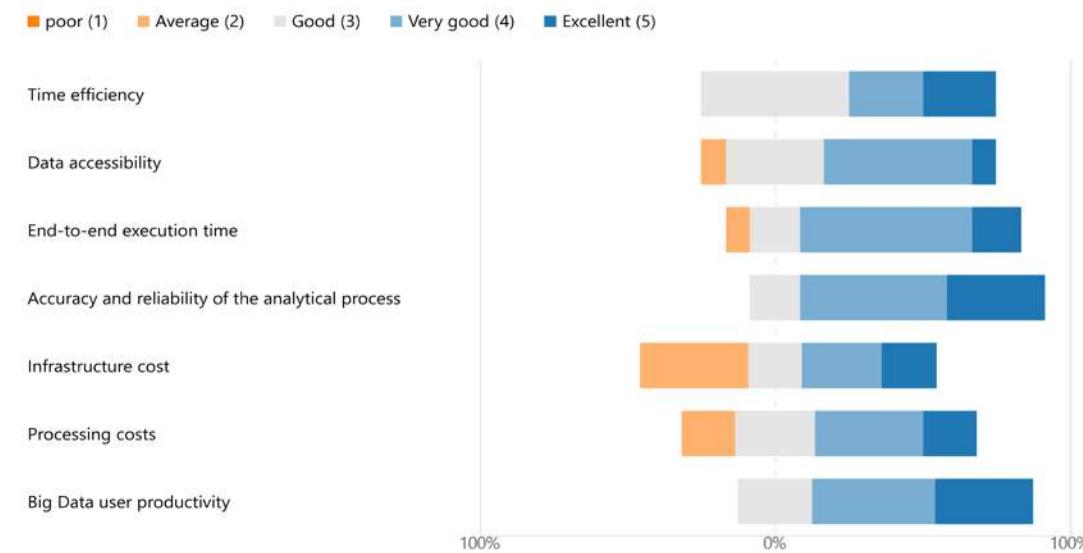

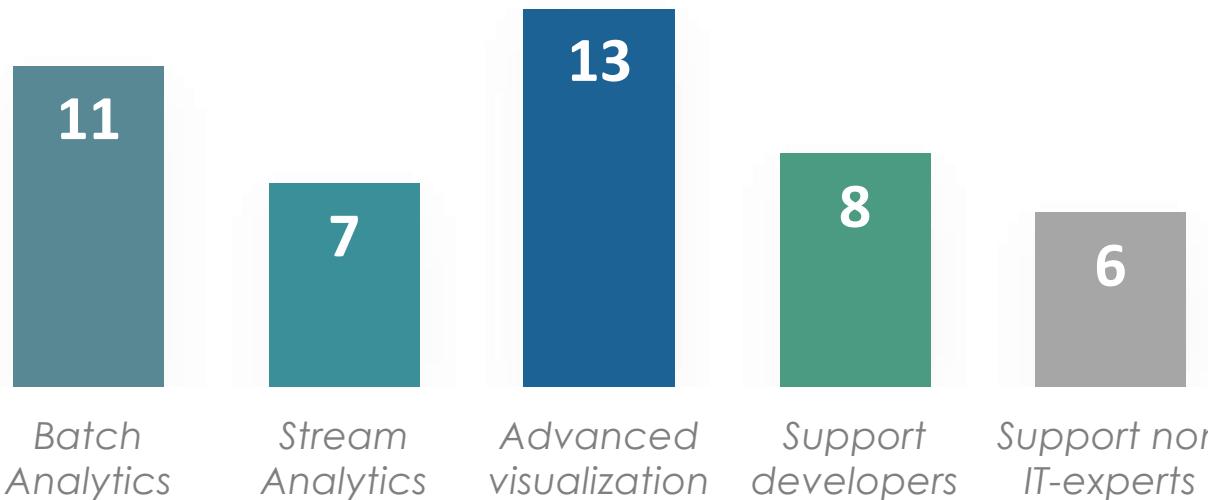

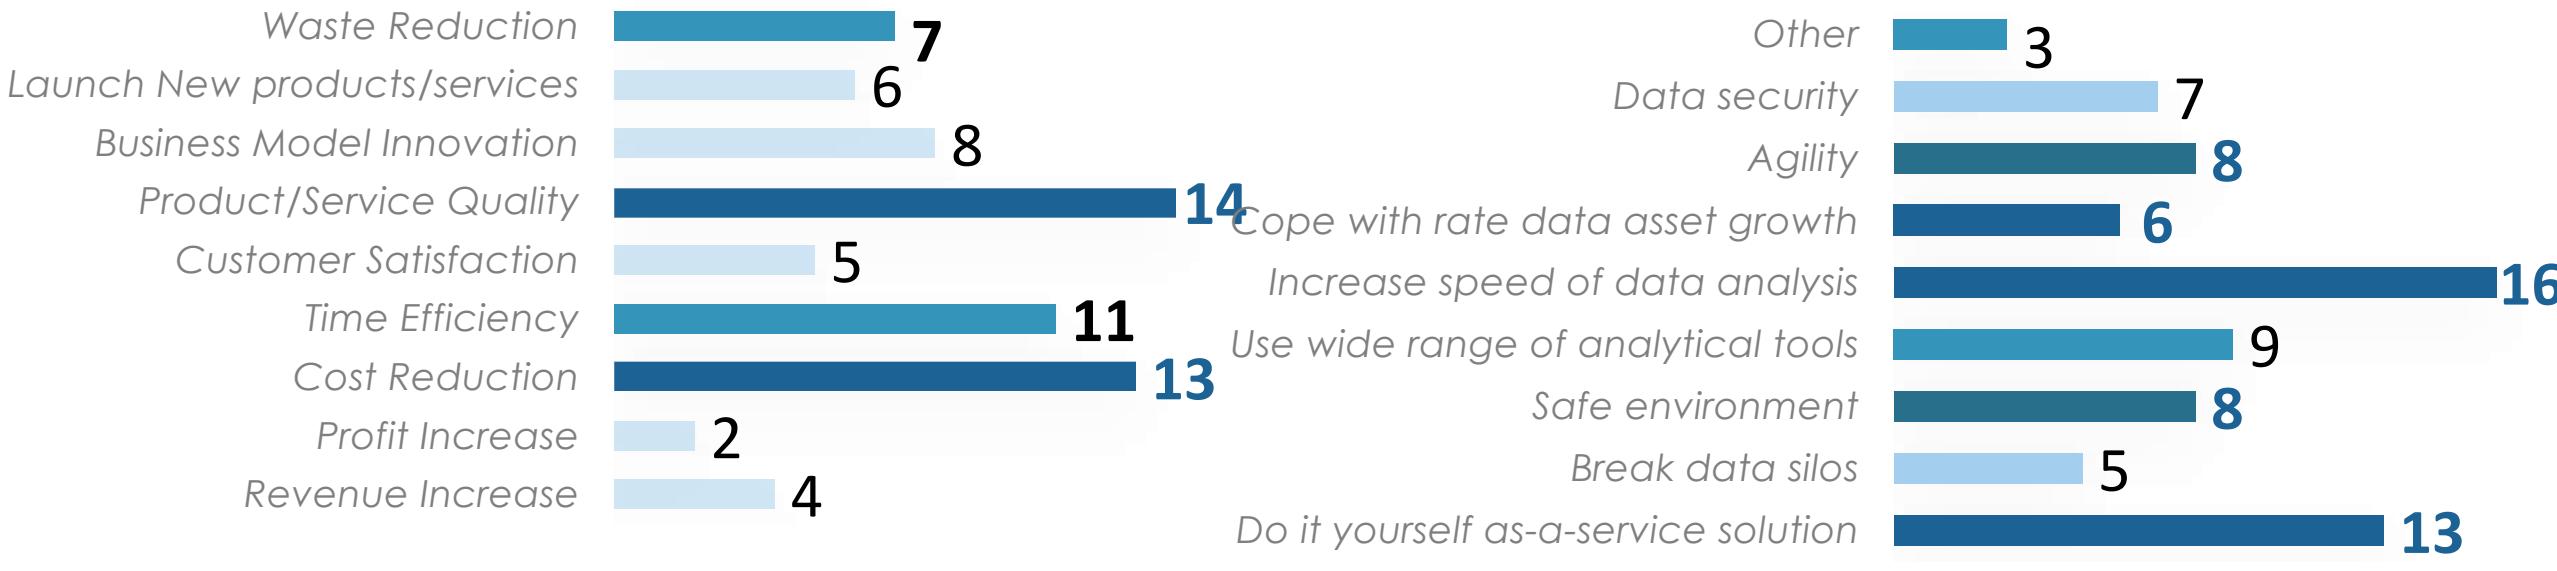

Share of Big Data and business Analytics revenue worldwide in 2019 by Industry

# Our results: Feedback from potential users

## Customer Development

||| Desk research > Interviews > Interactions > Tests > Users > Customers

## Product Development

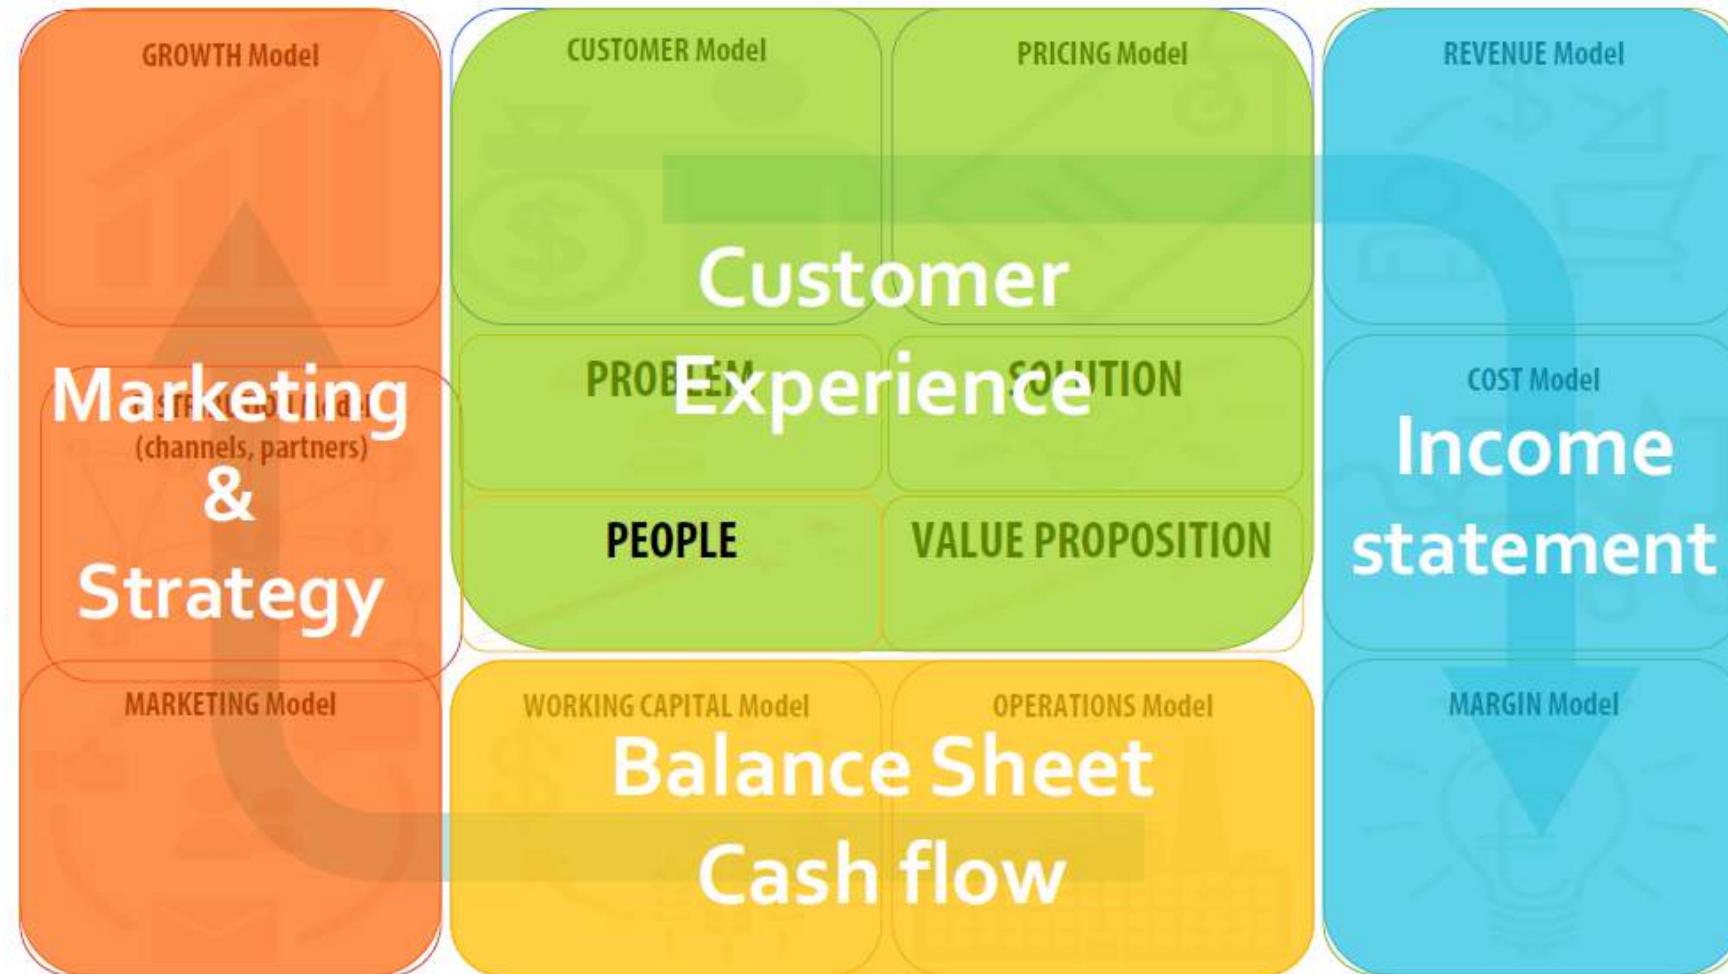

||| Faux-totype > Prototype(s) > MVP > Market fit > MDP > MAP > Wow UX!

## Business Model Development

||| Operable >> Viable >> Scalable >> Defendable >> Sustainable

# Dynamic Business Model: DBM

## GROWTH

**Scale 10x:** Industrial partners investment – partners provide technology

**How you will finance growth:**  
Raise of Equity

## CUSTOMER

### 10 first pioneers:

Existing use cases: banking, telecom, automotive industries.

### 100 early adopters:

Similar industries: Financial institutions, manufacturing companies, utilities and service operators.

New industries: Healthcare, retail, construction

## PRICING / PAYMENT

**License fee and consultancy:** At least 12 – 15 k€ per year – Subscription fee

## REVENUE

**Revenue model:** Open-Source License – Subscription

**Revenue streams:** batch processing and stream analytics

- License fee
- Consultancy

**Expected revenue 1<sup>st</sup> year:** 89.6 k€

## SALES

(distribution, channels, partners)

**Find the Product:** Open-source Apache 2.0

**Sales force:** Marketing and biz dev team (B2B; B2C)

**Partners:** I-BiDaaS consortium

## SOLUTION

Big Data as-a-service to empower IT experts and non-expert users to easily take advantages of the Big-Data technologies while increasing the speed of data analytics.

## PROBLEM

Companies with significant amount of diverse, distributed, noisy, incomplete, intermittent data, making difficult the extraction of value for non-expert users.

## VALUE PROP

Experimentation user friendly, modular, flexible, fast, and safe platform that handles significant volumes of sensitive data, and combine data sources.

## PEOPLE & SKILLS

I-BiDaaS team

## COSTS

### Main drivers:

- Development, maintenance, wages
- Fixed costs
- No changes with scale

**Expected cost 1<sup>st</sup> year:** 350 k€

## MARKETING

- Industrial Partners Success Stories
- Social media (Posts)
- Emails
- Website
- Partners website
- Participation in Trade Fairs

## CASH FLOW

|               | 2021     | 2022    | 2023    | 2024      |
|---------------|----------|---------|---------|-----------|
| OPEX (€)      | -190 562 | 200 396 | 732 717 | 1 364 685 |
| CAPEX (€)     | 74 800   | 124 800 | 174 800 | 209 800   |
| Financing (€) | 309 180  | -       | -       | -         |

## OPERATIONS

### What will you do:

- Dev. and maintenance use cases
- Marketing, Biz dev

### What will you outsource:

License: Apama; Usage: Qbeast

### Operation resources:

Capital: Raise of equity

I-BiDaaS technologies

## MARGINS

|              | 2021     | 2022    | 2023    | 2024      |
|--------------|----------|---------|---------|-----------|
| Gross margin | -112,3%  | 68,1%   | 83,3%   | 88,4%     |
| EBIT (€)     | -239 300 | 204 800 | 860 200 | 1 635 050 |

Medium margin

## **“Improve decision making whenever you want”**

### **User Friendly**

- IT expert & non-expert

### **Save Time**

- Increasing the speed of data Analytics

### **Save money**

- Less expensive data analytics

### **Upskill your team**

- Empower employees with crucial knowledge

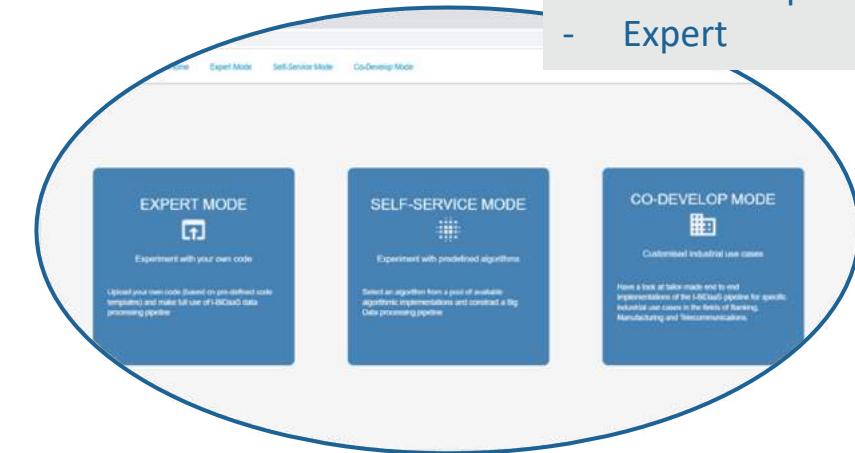

# Our business model

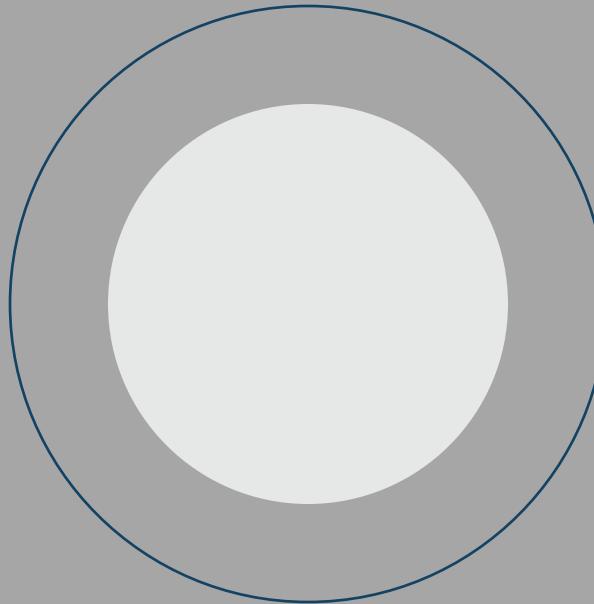

- Cloud
- On-premises

- License fee**
- Subscription: Annual, Monthly
- Consultancy services**
- Tailor made solutions

- Platform**
- Select algorithms
  - Create business insights
  - Visualizations

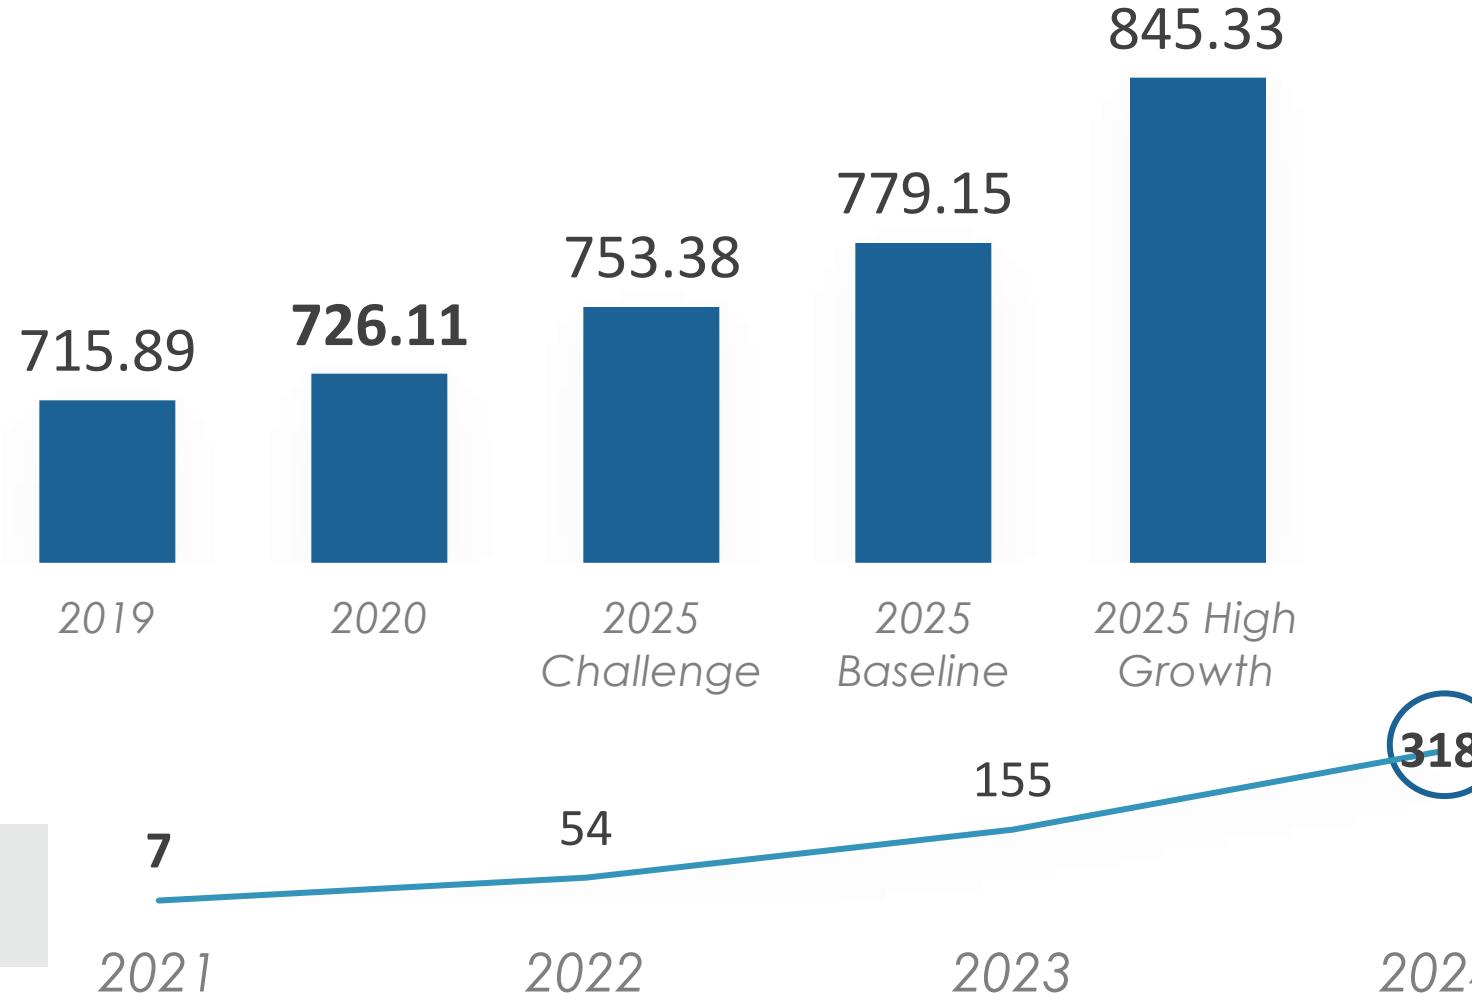

# Financial Forecast (4-Y)

# Data Market

Number of company data users in the European Union (EU) and United Kingdom (UK) Forecast 2025 (in thousands)

**2020 – 2025:**  
**27 000 - 119  
000  
companies**

**Market share:**  
**0,3 – 1,2%**

## Customer Acquisition

**2021**

1<sup>st</sup> phase

### LAUNCH STAGE (Innovators)

Implementation use cases industrial partners

- Banking
- Manufacturing
- Telecommunication

**2022 - 2023**

2<sup>nd</sup> phase

### GROWTH STAGE (Innovators – Early adopters)

Similar industries

- Financial institutions
- Fabricated metal industry
- Industrial & commercial machinery
- Services & Infrastructure operators

**2024**

3<sup>rd</sup> phase

### MATURITY STAGE (Early adopters)

New Industries

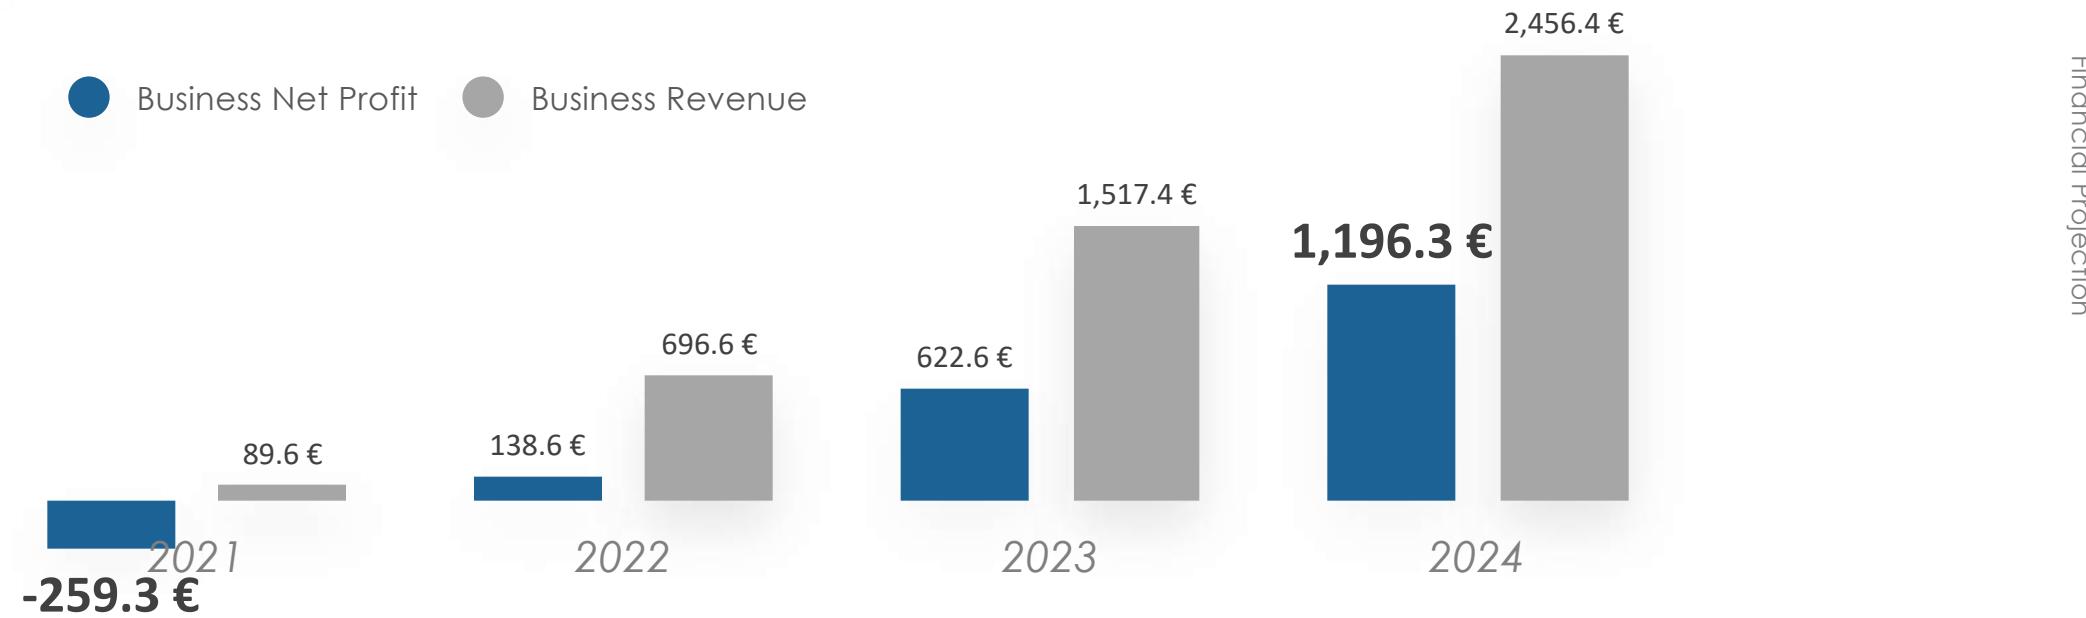

- HealthCare
- Retail

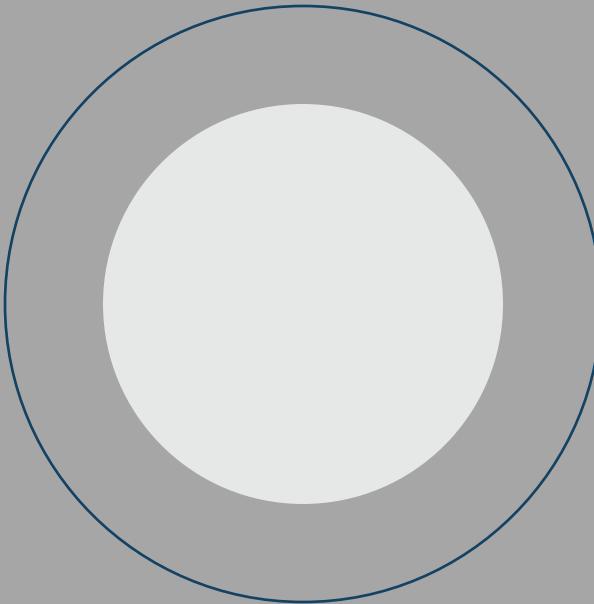

Customer Acquisition

# Financial Projection (expressed in thousands)

According to our conservative financial projection, our revenue as well as net profit will steadily increase over the next four years.

# The Path Forward

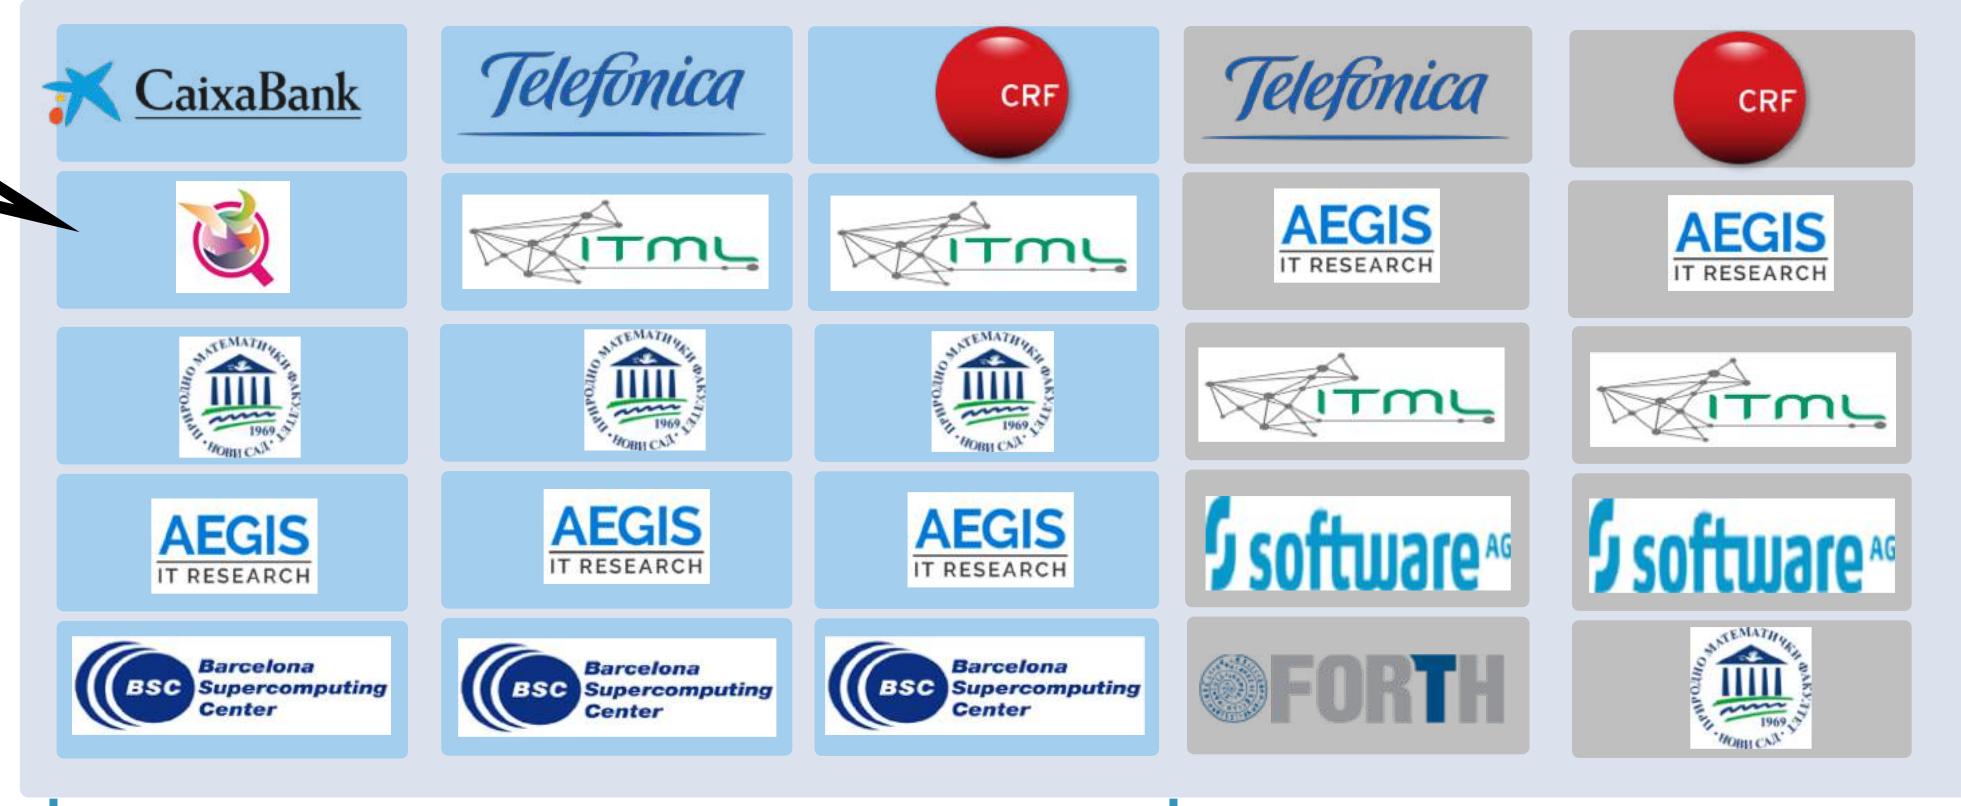

# The path forward: Long-term sustainability

## Identification of Synergies

## Stream Analytics

Qbeast (e.g.) evolution  
of a technology →  
patented

## Batch Processing

# Qbeast – Big Data free from the unnecessary

Why waste time and money computing data that doesn't make a difference

Get the results you need, accessing only a fraction of the data.

- Patented technology from the
- Storage accelerator based on our proprietary **multidimensional indexing and sampling** technology

for

**Data Scientists** struggling with slow and complex Big Data platforms.

**Data Engineers** dissatisfied with the complexity of building and maintaining analytics products

**3x**

more productive data teams

**Value**

Advanced ML tools for the whole organization

**Early Adopters**

Enterprise Spark users

<https://qbeast.io/>

**100x**

Up to 100X faster data analysis

**Cost Savings**

Pay only for the data analyzed

**Pricing**

**Qbeast Storage**

**8€** per Terabyte accessed

# The path forward: Banking sector

## Caixa Garage Lab

### Description

- Information Security Garage Lab during the first semester of 2021.
- This infrastructure is a sandbox especially designed to evaluate innovative tools

### Strategy

1st

Access I-BiDaaS & extract information from the three use cases.

2nd

Deploy I-BiDaaS in Caixa Garage Lab to evaluate the tool.

3rd

**Potential achievements:**  
Integrate I-BiDaaS inside Caixa & experiment with different use cases.

## Telefonica Internal Innovation Call

### Description

### Potential achievements

\_Your ideas are going to be implemented in our open sandboxes to accelerate the construction of new connectivity solutions together

#### \BUILD PRODUCTS TOGETHER

Telefonica, Telefonica partners and startups to co-design and co-construct new products.

#### \LEAN STARTUP PROCESSES

Fast stage gating process with focus on getting out of the lab to validate with end users.

#### \ACCESS TO TELCO ENVIRONMENT

Build with smaller gap with production network: access to Telefonica assets (network & systems lab).

#### \FAST TRACK TO CUSTOMERS

Access to live trials with Telefonica customers to validate solution and accelerate TTM of products.

— Accelerate commercial, technical and operational validation.

# The path forward: Manufacturing sector

## CRF Training environment

### Description

- Training sessions with end-users in 2021.
- Provide Big Data culture

### Strategy

1st

Presentation use cases,  
type of data collected and  
how data have been  
managed to perform the  
analytics

2nd

To show and explain step-by-step the I-BiDaaS platform's  
Interactive session to test  
the different features with  
the employees

3rd

Integrate I-BiDaaS inside CRF  
premises & implement  
Circular Business Model to  
extend life cycle of products

That ultimately drives long term value creation

## Circular Business Models: Product life-extension (CRF)

**Product life extension enables companies to extend the lifecycle of products and assets so value that would otherwise be lost through wasted materials is instead maintained or even improved**

### Overall Equipment Effectiveness (OEE)

Increase of 1-1.5 % in current Overall Equipment Effectiveness (OEE)

### Cost reduction

Decrease of 20-30 % in maintenance costs

### Job-per-Hour (JPH)

Assess the process performance & measures the throughput of the line per hour.

### Quality levels

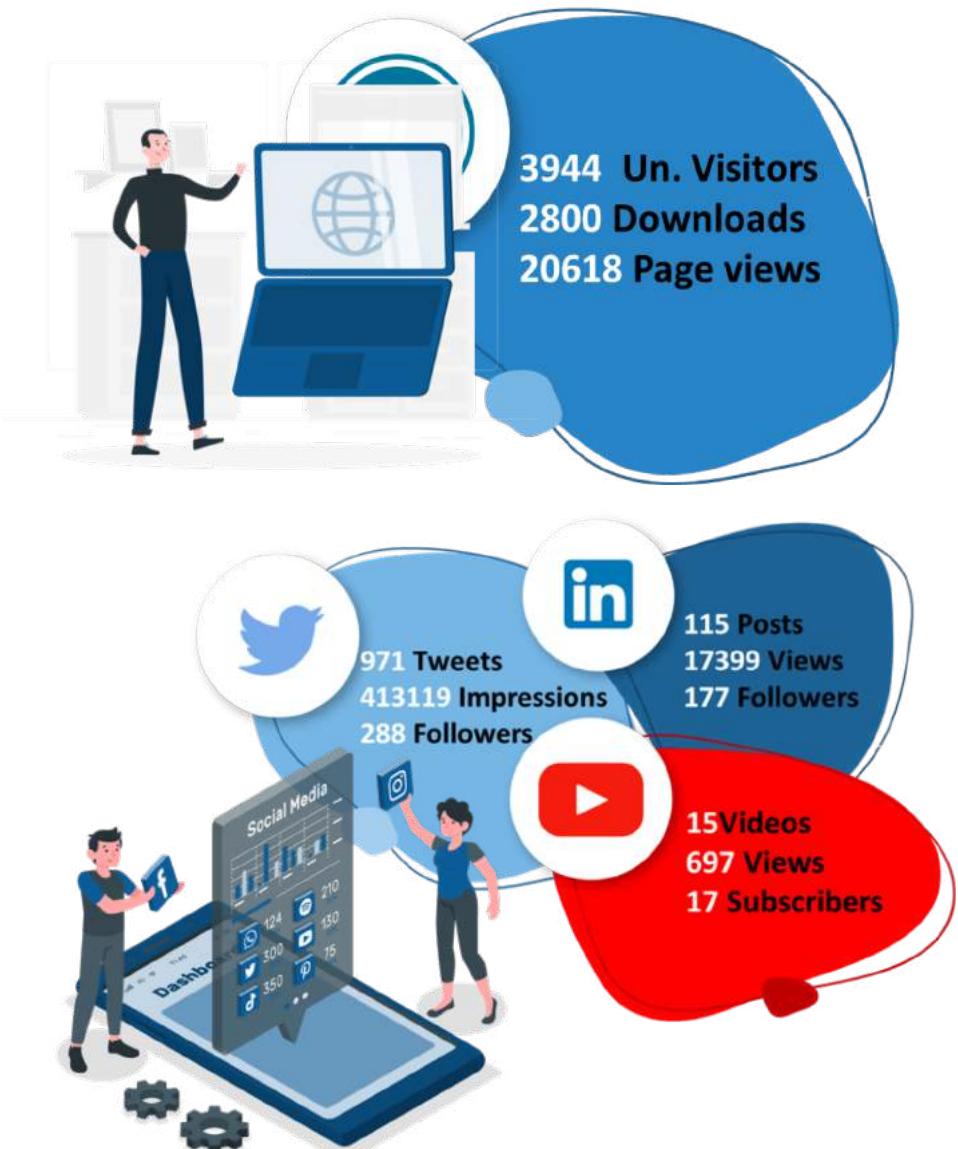

Increase of 3-7 % good products  
Decrease of 1-4% and 0.5-2 % defective products
